

Organotypic cultures as tools for optimizing central nervous system cell therapies

Submitted by Claudia Montero... on Mon, 06/29/2015 - 15:29

Titre	Organotypic cultures as tools for optimizing central nervous system cell therapies
Type de publication	Article de revue
Auteur	Daviaud, Nicolas [1], Garbayo, Elisa [2], Schiller, Paul C [3], Perez-Pinzon, Miguel [4], Montero-Menei, Claudia [5]
Pays	Pays-Bas
Editeur	Elsevier
Ville	Amsterdam
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	2013 Oct
Pagination	429-440
Volume	248
Titre de la revue	Experimental Neurology
ISSN	1090-2430
Mots-clés	Animals [6], Central nervous system [7], Humans [8], neurodegenerative diseases [9], Neurons [10], Organ Culture Techniques [11], Stem Cell Transplantation [12], tissue engineering [13]
Résumé en anglais	<p>Stem cell therapy is a promising treatment for neurological disorders such as cerebral ischemia, Parkinson's disease and Huntington's disease. In recent years, many clinical trials with various cell types have been performed often showing mixed results. Major problems with cell therapies are the limited cell availability and engraftment and the reduced integration of grafted cells into the host tissue. Stem cell-based therapies can provide a limitless source of cells but survival and differentiation remain a drawback. An improved understanding of the behaviour of stem cells and their interaction with the host tissue, upon implantation, is needed to maximize the therapeutic potential of stem cells in neurological disorders.</p> <p>Organotypic cultures made from brain slices from specific brain regions that can be kept in culture for several weeks after injecting molecules or cells represent a remarkable tool to address these issues. This model allows the researcher to monitor/assess the behaviour and responses of both the endogenous as well as the implanted cells and their interaction with the microenvironment leading to cell engraftment. Moreover, organotypic cultures could be useful to partially model the pathological state of a disease in the brain and to study graft-host interactions prior to testing such grafts for pre-clinical applications. Finally, they can be used to test the therapeutic potential of stem cells when combined with scaffolds, or other therapeutic enhancers, among other aspects, needed to develop novel successful therapeutic strategies or improve on existing ones.</p>
