

Aspergillus fumigatus: cell wall polysaccharides, their biosynthesis and organization

Submitted by Amandine Gastebois on Mon, 06/22/2015 - 14:38

Titre	Aspergillus fumigatus: cell wall polysaccharides, their biosynthesis and organization
Type de publication	Article de revue
Auteur	Gastebois, Amandine [1], Clavaud, Cécile [2], Aïmanianda, Vishukumar [3], Latgé, Jean-Paul [4]
Pays	Royaume-Uni
Editeur	Future Medicine
Ville	London
Type	Article scientifique dans une revue sans comité de lecture
Année	2009
Langue	Anglais
Date	Juin 2009
Numéro	5
Pagination	583-595
Volume	4
Titre de la revue	Future Microbiology
ISSN	1746-0921
Mots-clés	Antifungal Agents [5], Aspergillus fumigatus [6], Biosynthetic Pathways [7], Cell Wall [8], Polysaccharides [9]
Résumé en anglais	<p><i>Aspergillus fumigatus</i> is the most prevalent thermophilic inhabitants of decaying vegetation and one of the most important human opportunistic fungal pathogens. Like other fungi, <i>A. fumigatus</i> cells are covered by a cell wall, which is both a protective, rigid exoskeleton and a dynamic structure, undergoing constant modification depending on its environment. The cell wall, in the majority of fungi, is composed of polysaccharides, and understanding the biochemical organization and biogenesis of an <i>A. fumigatus</i> cell wall is essential as this envelop is continuously in contact with the environment/host cell and acts as a sieve and reservoir for molecules, such as enzymes and toxins that play an active role during infection. This article is intended to give an overview of the biosynthesis of constituent cell wall polysaccharides and their postsynthetic modification in <i>A. fumigatus</i>, it also discusses the antifungal drugs that affect cell wall polysaccharide biosynthesis.</p>
