

Conventional versus stealth lipid nanoparticles: formulation and in vivo fate prediction through FRET monitoring.

Submitted by Laurent Lemaire on Thu, 01/08/2015 - 10:35

Titre	Conventional versus stealth lipid nanoparticles: formulation and in vivo fate prediction through FRET monitoring.
Type de publication	Article de revue
Auteur	Lainé, Anne-Laure [1], Gravier, Julien [2], Henry, Maxime [3], Sancey, Lucie [4], Bejaud, Jérôme [5], Pancani, E [6], Wiber, M [7], Texier, Isabelle [8], Coll, Jean-Luc [9], Benoît, Jean-Pierre [10], Passirani-Malleret, Catherine [11]
Editeur	Elsevier
Type	Article scientifique dans une revue à comité de lecture
Année	2014
Langue	Anglais
Date	2014 Aug 28
Pagination	1-8
Volume	188
Titre de la revue	Journal of Controlled Release
ISSN	1873-4995
Résumé en anglais	<p>The determination of the nanocarrier fate in preclinical models is required before any translation from laboratory to clinical trials. Modern fluorescent imaging techniques have gained considerable advances becoming a powerful technology for non-invasive visualization in living subjects. Among them, Forster (fluorescence) resonance energy transfer (FRET) is a particular fluorescence imaging which involves energy transfer between 2 fluorophores in a distance-dependent manner. Considering this feature, the encapsulation of an acceptor/donor pair in lipid nanoparticles (LNEs: lipid nanoemulsions, LNCs: lipid nanocapsules) allowed the carrier integrity to be tracked. Accordingly, we used this FRET technique to evaluate the behavior of LNEs, conventional LNCs and newly designed stealth LNCs. After the development through a one-step (OS) PEGylation process of these stealth LNCs (OS LNCs), in vitro guest exchange dynamics and release kinetics were evaluated for both LNC formulations. We thereafter assessed in vivo biodistribution of all types of lipid nanoparticles. Results showed enhanced stability of encapsulation in OS LNCs in comparison to conventional LNCs. Additionally, the presence of the long PEG chains on the lipid nanoparticle surface altered the biodistribution pattern. Despite different release kinetic profiles, OS LNCs and LNEs showed extended blood circulation time associated with a good structure stability over several hours after intravenous injection.</p>
