#### Abstract

A simple and efficient three-step methodology is described for the first time for the synthesis of 2 -(hetero)arylthieno[2,3-b] or [3,2-b]pyridines. The first step is a Sonogashira coupling from 3-bromo-2-chloropyridine or 2-bromo-3-chloropyridine with several (hetero)arylalkynes to obtain the corresponding 2 - or 3 -chloro(hetero)arylethynylpyridines. These were cyclized by treatment with $\mathrm{Na}_{2} \mathrm{~S}$ affording the expected 2-(hetero)arylthienopyridines. As an improvement, these reactions were also performed in one-pot, without the isolation of the Sonogashira product, giving the thienopyridines in similar or better yields, reducing significantly the reaction time after the addition of $\mathrm{Na}_{2} \mathrm{~S}$. Further functionalizations were achieved in the thienopyridine system either by bromination in the thiophene ring or chlorination in the pyridine ring via a $N$-oxide intermediate, allowing metal-catalyzed coupling reactions and/or nucleophilic substitutions. The functionalization of some substituents is also possible and as an example a 1,3-diarylurea was obtained from the reaction of an aniline derivative with an arylisocyanate.

## 1. Introduction

Pyridine derivatives have attracted considerable interest because of their great practical usefulness due to their various biological activities. Among them, fused analogues are often much more biologically active. More particularly, thienopyridines have been shown to exhibit a large variety of biological activities. ${ }^{1}$ Nowadays the chemistry of the $[2,3-b]-$ isomers is better known in comparison with the [3,2-b]-isomers. The diversity of biological activities gave an impulse to the development of convenient synthetic routes for the synthesis of the thieno[3,2-b]pyridine system. Most of the methods for the synthesis of thieno[3,2-b]pyridines are based on the use of readily accessible 3 -aminothiophenes or their N -derivatives ${ }^{2}$ and only few synthesis have already been described starting from the pyridine ring. ${ }^{3}$ For example, Fort et al. have reported a three-step process allowing the construction of the thiophene ring. The key step was the almost regioselective lithiation-bromination of the 3-methylthiopyridine induced by the BuLi-LiDMAE superbase (DMAE: 2-(dimethylamino)ethanol) followed by a Sonogashira coupling and a halogenocyclization to give the corresponding 2substituted (Ph or TMS) 3-halothieno[3,2-b]pyridines. ${ }^{3 d}$

In the last few years our group has been interested in the synthesis of thieno[3,2-b]pyridine derivatives. We have reported a one-pot two-step synthesis of the methyl 3-amino-6-bromothieno[3,2-b]pyridine-2-carboxylate from 5-bromo-3nitropicolinonitrile and methyl thioglycolate in DMF/KOH(aq). ${ }^{4}$ This product was obtained in excellent yield and it was further functionalized by C-C (Suzuki, Sonogashira) ${ }^{5 \mathrm{a}, \mathrm{b}}$ or C-N (Buchwald-Hartwig) ${ }^{5 \mathrm{c}}$ couplings, to give new derivatives exhibiting inhibitory growth activity in human tumor cell lines. ${ }^{5}$

Herein, we describe a new and general method for the synthesis of thieno[2,3-b] and [3,2-b]pyridines bearing a (hetero)aryl substituent in the 2-position, from 2- or 3chloro(hetero)arylethynylpyridines obtained by Sonogashira coupling of 2,3-dihalopyridines with (hetero)arylalkynes, followed by treatment with sodium sulfide $\left(\mathrm{Na}_{2} \mathrm{~S}\right)$ as depicted in Scheme 1.

## 2. Results and discussion

Optimization experiments were first carried out on the Sonogashira reaction ${ }^{6}$ of the 3-bromo-2-chloropyridine with phenylacetylene using $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ as the catalyst, CuI as the cocatalyst. The best conditions were the ones presented in Scheme 2, using $\mathrm{Et}_{3} \mathrm{~N}$ as the base and the solvent, with only a slight excess of phenylacetylene ( 1.1 equiv.), as it is well known that an important side reaction, namely the Glaser-type oxidative dimerization of the alkyne, usually occurs in the presence of $\mathrm{Cu}(\mathrm{I}) .{ }^{7}$

Scheme 2. Sonogashira coupling of 3-bromo-2-chloropyridine with phenylacetylene.

The isolation of the 2,3-bis(phenylethynyl)pyridine as a minor product has been observed and its formation increases with the reaction time.

Using these conditions various 2-chloro-3-ethynylpyridines were synthesized in moderate to good yields (Table 1, products $\mathbf{1 - 1 3}$ ). The reaction time being quite low, the moderate yields that were obtained with some aryl and heteroarylalkynes were mostly related to the dimerization of the alkyne, and not to the formation of the di(hetero)arylethynylpyridine, as it occurred when phenylacetylene was used (Scheme 2).

The synthesis of the corresponding 3-chloro-2ethynylpyridines was also performed, using the same conditions (Table 1, products 14-26). As expected, the yields were much higher when 2-bromo-3-chloropyridine was used as the starting material, due to the better activation of the bromine in the 2position for the Sonogashira coupling. Thus, all the expected 3-chloro-2-(hetero)arylethynylpyridines were synthesized in very good to excellent yields from either electron-rich or electron-poor (hetero)arylalkynes (from $70 \%$ to $93 \%$ ).

The synthesis of annulated thiophene rings from orthohaloalkynyl antraquinones, benzenes, naphthalenes, and pyrazoles to give antrathiophenediones, ${ }^{\text {8a }}$ benzo $[b]$ thiophenes, ${ }^{8 \mathrm{~b}, \mathrm{c}}$
naphthodithiophenes, ${ }^{\text {8d,e }}$ and thieno[2,3-c] pyrazoles, ${ }^{8 f}$ respectively, has already been described using $\mathrm{Na}_{2} \mathrm{~S}$.

In the present work the reaction of the Sonogashira coupling products 1-26 with $\mathrm{Na}_{2} \mathrm{~S}$ overnight, gave the thieno[2,3$b$ ]pyridines 27-39 and the thieno[3,2-b]pyridines 40-52 in good to excellent yields (Table 1). This methodology was applied by us for the first time to the synthesis of thienopyridine derivatives.

A plausible mechanism is a nucleophilic attack ( $\mathrm{S}_{\mathrm{N}} \mathrm{Ar}$ ) of the hydrosulfide ion on the ortho-chloroalkynylpyridine followed by an intramolecular addition on the triple bond but on the other hand an addition of the hydrosulfide ion to the triple bond may occur, followed by a $\mathrm{S}_{\mathrm{N}} \mathrm{Ar} /$ cyclization (Scheme 3).

Scheme 3. Plausible mechanisms for the synthesis of 2-(hetero)arylthieno[2,3-b] or [3,2-b]pyridines from the orthochoroalkynylpyridines

Unexpected results were obtained for the cyclization of the ortho-methoxylated Sonogashira coupling products 7 and 20: instead of the expected 2-(2-methoxyphenyl)thienopyridines, the cyclization with $\mathrm{Na}_{2} \mathrm{~S}$ gave the corresponding hydroxylated thienopyridines 33 and 46 in good to high yields (Table 1), maybe due to the spatial proximity of the sulfide anion intermediate with the methoxy group.

We have also used this methodology through a one-pot procedure. Thus, after coupling the 2,3-dihalopyridines with (hetero)arylalkynes at $100{ }^{\circ} \mathrm{C}$ for $2 \mathrm{~h}, \mathrm{Na}_{2} \mathrm{~S}$ was added to the reaction mixture without the isolation of the Sonogashira coupling product and the solution was allowed to stir at $130^{\circ} \mathrm{C}$ for a further 2 h . Some examples were performed using these conditions and the thienopyridines 27, 28, 30-32, 36-41, 43-45 and 49-52 were obtained in good to excellent yields (Table 2). The expected thienopyridines were purified by recrystallization or dry flash chromatography. The yields obtained under this onepot procedure were at least as good and often higher than those obtained when the reactions were performed with isolation of the Sonogashira coupling product.

After adding $\mathrm{Na}_{2} \mathrm{~S}$, the reaction was much faster when performed in one-pot, as only 2 h of heating were required for the reaction to reach completion. This is agreement with Müller et $a l .{ }^{9}$ that for the synthesis of several annulated 4 H -thiopyran-4ones by one-pot microwave-assisted reaction, from ortho-chloro or fluoro(hetero)aroylchlorides, alkynes and $\mathrm{Na}_{2} \mathrm{~S}$, postulated that the cyclizing step is assisted by Pd and/or Cu .

${ }^{\text {a }}$ global yields calculated for the synthesis in two-pot of thienopyridines

To valorize this work, some of the thienopyridines obtained were further functionalized. Our group is interested in the synthesis of di(hetero)arylureas from thienopyridine derivatives bearing an amine moiety. Indeed, it has been well established that urea derivatives have got a significant place in modern medicinal chemistry as they have been reported in the literature as anticancer agents, ${ }^{10}$ anticonvulsant ${ }^{11}$ and $\mathrm{CXCR}_{3}$ antagonist. ${ }^{12}$ 1,3-Diarylurea derivatives, and particularly in the thienopyridine series, were also reported as cell growth factor receptor tyrosine kinase inhibitors, as anticancer and/or antiangiogenic compounds. ${ }^{\text {If,13 }}$ The reaction of 2-(thieno[3,2$b$ ]pyridin-2-yl)aniline $\mathbf{4 3}$ with 4-methoxyphenylisocyanate was performed at room temperature and successfully provided the expected 1-(4-methoxyphenyl)-3-[2-(thieno[3,2-b]pyridin-2yl)phenyl]urea 53 in excellent yield (Scheme 4).

Scheme 4. Synthesis of the new 1,3-diarylurea $\mathbf{5 3}$ from thieno[3,2b]pyridine $\mathbf{4 3}$ and 4-methoxyphenylisocyanate.

The halogenation of some thienopyridines was also performed. The presence of a bromine or a chlorine atom will allow further functionalizations by metal-catalyzed coupling reactions ( $\mathrm{C}-\mathrm{C}, \mathrm{C}-\mathrm{N}$ and $\mathrm{C}-\mathrm{O}$ ) or nucleophilic substitution, leading to the synthesis of new thienopyridine derivatives.

The bromination in the 3-position of the 2phenylthienopyridines 27 and $\mathbf{4 0}$ was done using $\mathrm{Br}_{2}$ in dry ether at $0{ }^{\circ} \mathrm{C}$, affording the corresponding 3-bromo-2phenylthienopyridines $\mathbf{5 4}$ and 55 in moderate yields (Scheme 5). With 2-(pyridin-3-yl)thieno[2,3-b]pyridine 37, the expected 3-bromo derivative 56 was obtained in a good yield (65\%) using dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as the solvent due to the low solubility of the starting material.

Scheme 5. i: $\mathrm{Br}_{2}$ (1.1 equiv.), dry $\mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 30-60 \mathrm{~min}$. ii: dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ used as the solvent.

Compound $\mathbf{5 5}$ was already obtained by Fort et al. ${ }^{3 \mathrm{~d}}$ in a total yield of $32 \%$ in a three-step methodology starting from 3methylthiopyridine (that has to be previously synthesized by reacting 3-bromopyridine with $t \mathrm{BuLi}$ and dimethylsulfur). However this methodology implies the use of delicate reaction conditions (the use of $n \mathrm{BuLi}$ and $t \mathrm{BuLi}$ requires to work in extremely dry conditions, under argon, and at temperatures as low as $-90^{\circ} \mathrm{C}$, and the reactions were not completely regioselective. In our case, product 55 was synthesized from the commercially available 2-bromo-3-chloropyridine also in three steps in a better total yield ( $40 \%$ through the one-pot procedure for compound 40), using simple and regioselective reactions.

Chlorination in the 4-position of the thieno[2,3-b]pyridine 32 was also performed, following a procedure via the preparation of the $N$-oxide using 3-chloroperoxybenzoic acid (MCPBA). ${ }^{14}$ After evaporation of the solvents the solid obtained was treated with $\mathrm{POCl}_{3}$ using $\mathrm{CHCl}_{3}$ as the solvent ${ }^{15}$ to afford the 4-chlorothieno[2,3-b]pyridine 57 in high yield (Scheme 6). This will allow the functionalization of the pyridine ring of the system which is also important for the synthesis of biologically active compounds.

## 3. Conclusion

We have developed a general and efficient methodology for the synthesis of 2-(hetero)arylthieno[2,3-b] or [3,2-b]pyridines from 2,3-dihalopyridines, (hetero)arylalkynes and $\mathrm{Na}_{2} \mathrm{~S}$, that works also in a one-pot procedure, reducing significantly the time of the last steps. The compounds obtained were submitted
to further functionalizations. A 1,3-diarylurea was prepared as an example of functionalization of thienopyridines bearing an aniline with an arylisocyanate. The corresponding 3-bromo2 -(hetero)arylthienopyridines were successfully obtained after bromination with bromine. An example of chlorination in the pyridine ring was also presented with the synthesis of the 4-chloro-2-(3-methoxyphenyl)thieno[2,3-b]pyridine, via the corresponding $N$-oxide followed by the reaction with $\mathrm{POCl}_{3}$. These thienopyridines may be used as precursors to synthesize biologically active compounds.

## 4. Experimental section

4.1. General methods: Melting points $\left({ }^{\circ} \mathrm{C}\right)$ were determined in a Stuart SMP3 and are uncorrected. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker Avance III at 400 and 100.6 MHz or on a Varian Unity Plus at 300 and 75.4 MHz , respectively. Heteronuclear correlations ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$, HMQC or HSQC and HMBC were performed to attribute some signals. Elemental analyses were determined on a LECO CHNS 932 elemental analyzer. MS-EI, MS-ESI and HRMS on the $\mathrm{M}^{+}$or on the $\left[\mathrm{M}^{+}+\mathrm{H}\right]$ data were recorded by the mass spectrometry service of the University of Vigo, Spain.

Column chromatography was performed on Macherey-Nagel silica gel 230-400 mesh or on silica-gel. Preparative layer chromatography (PLC) was performed on Macherey-Nagel 20 $\mathrm{x} 20 \mathrm{~cm}^{2}$ silica plates, layer 2 mm SIL G-200 UV 254 . Petroleum ether refers to the boiling range $40-60{ }^{\circ} \mathrm{C}$. Ether refers to diethyl ether. The increase of polarity in solvent gradient was made from neat petroleum ether to mixtures of ether/petroleum ether, increasing $10 \%$ of ether each time until the isolation of the products, unless stated otherwise. The most polar products were isolated using neat ether, mixtures of ether/ethyl acetate or neat ethyl acetate.

### 4.2. General experimental conditions for the Sonogashira reactions:

In a dry Schlenk tube, the dihalopyridine, $\mathrm{CuI}(6 \mathrm{~mol} \%)$ and $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(3 \mathrm{~mol} \%)$ were added in $\mathrm{Et}_{3} \mathrm{~N}(2 \mathrm{ml}$ per mmol of pyridine). After stirring for 10 minutes, the (hetero)arylacetylene ( 1.0 or 1.1 equiv.) was added, and the solution was heated to $100{ }^{\circ} \mathrm{C}$ in a silicone bath for 2 h . The reactions were monitored by TLC, following the disappearance of the starting materials. After completion, the mixture was allowed to cool to room temperature. Then ethyl acetate and water were added and the organic phase was separated, dried $\left(\mathrm{MgSO}_{4}\right)$ and filtered. Removal of the solvent under reduced pressure gave either oils which were submitted to column chromatography or pure products corresponding to the expected (hetero)arylethynyl)pyridines.

### 4.3. General conditions for the synthesis of thienopyridines:

Two-pots: A suspension of the (hetero)arylethynylpyridines with $\mathrm{Na}_{2} \mathrm{~S}$ (4.0 equiv.) in DMF was stirred in an oil bath at 130 ${ }^{\circ} \mathrm{C}$ overnight. Then the mixture was diluted with $\mathrm{H}_{2} \mathrm{O}$ and extracted three times with ethyl acetate. The combined organic layers were washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and concentrated to dryness under reduced pressure, affording the expected thienopyridines as solids.
One-pot: the Sonogashira reaction was performed according to 4.2. After completion, $\mathrm{Na}_{2} \mathrm{~S}$ (4.0 equiv.) in DMF was added and the mixture was heated at $130^{\circ} \mathrm{C}$ during 2 h . After workup (described in 4.3) the crude product was purified by recrystallization or dry flash chromatography.

### 4.3.1. 2-Phenylthieno[2,3-b]pyridine (27)

From compound $1(91.0 \mathrm{mg}, 0.426 \mathrm{mmol})$, compound 27 was obtained as an orange solid ( $81.0 \mathrm{mg}, 90 \%$ ). Recrystallization from ether/petroleum ether gave orange crystals, m.p. $88-90^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=7.29$ (dd, $J=8.0$ and $4.8 \mathrm{~Hz} \mathrm{1H}, 5-\mathrm{H}$ ), 7.36-7.41 (m, 1H), 7.44-7.48 $(\mathrm{m}, 3 \mathrm{H}), 7.73(\mathrm{~m}, 2 \mathrm{H}), 8.02$ (dd, $J=8.0$ and $1.6 \mathrm{~Hz}, 1 \mathrm{H}, 4-\mathrm{H})$, 8.53 (br d, 1H, $6-\mathrm{H}$ ) ppm. ${ }^{13} \mathrm{C}$ NMR ( $100.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=$ $116.62(\mathrm{CH}), 119.79(5-\mathrm{CH}), 126.56(2 \times \mathrm{CH}), 128.80(\mathrm{CH})$, $129.03(2 \times \mathrm{CH}), 130.66(4-\mathrm{CH}), 133.81$ (C), 134.24 (C), 144.55 (C), 146.24 ( $6-\mathrm{CH}$ ), 161.46 (C) ppm. ### 4.5. General conditions for the bromination in position 3:

In a dry Schlenk tube, thienopyridines $27, \mathbf{3 7}$ or $\mathbf{4 0}$ were put in dry $\mathrm{Et}_{2} \mathrm{O}$ or dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Then, $\mathrm{Br}_{2}$ (1.1 equiv.) was added dropwise at $0{ }^{\circ} \mathrm{C}$ and the solution was stirred at this temperature for 30 min to 1 h . Then the mixture was diluted with $\mathrm{H}_{2} \mathrm{O}$ and extracted with ethyl acetate. The combined organic layers were dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and the solvent was removed under reduced pressure. The resulting crudes were submitted to column chromatography or PLC to give the expected 3-bromo-2-phenylpyridines.

### 4.6. Chlorination of the thieno[2,3-b]pyridine 32:

4.6.1. 4-Chloro-2-(3-methoxyphenyl)thieno[2,3b]pyridine (57)

To compound $32(60.0 \mathrm{mg}, 0.250 \mathrm{mmol})$ in 6 mL DME/hexane (1:2), MCPBA (1.2 equiv.) was added portionwise at $0^{\circ} \mathrm{C}$ and the mixture was left stirring for 40 h at rt , following the reaction by tlc. After this time the solvents were evaporated and the resulting solid was put in $\mathrm{CHCl}_{3}$ and $\mathrm{POCl}_{3}$ ( 19.5 equiv) was added dropwise at $0{ }^{\circ} \mathrm{C}$. After 3 h the reaction was completed, ice $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}$ sat. were added and the reaction was extracted with $\mathrm{CHCl}_{3}$. The organic phases were collected, dried with MgSO 4 , filtered and evaporated to give a brown oil. This was submitted to PLC ether/petroleum ether 2:1 and compound 57 was obtained as a yellow solid ( $60.0 \mathrm{mg}, 86 \%$ ) m.p $95-96{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ $=3.90(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe}), 7.35-7.45(\mathrm{~m}, 3 \mathrm{H}), 7.58-7.61(\mathrm{~m}, 1 \mathrm{H})$, $7.62(\mathrm{~s}, 1 \mathrm{H}, 3-\mathrm{H}), 8.00-8.03(\mathrm{~m}, 1 \mathrm{H}), 8.10-8.11(\mathrm{~m}, 1 \mathrm{H}), 8.50$ (br s, $1 \mathrm{H}, 6-\mathrm{H}$ ) ppm. ${ }^{13} \mathrm{C}$ NMR ( $100.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=55.45$ (OMe), 114.96 (3-CH), 119.28 (CH), 120.26 (C), 128.27 (CH), $129.80(\mathrm{CH}), 130.23(\mathrm{CH}), 131.11(\mathrm{C}), 133.77(\mathrm{CH}), 134.67$ (C), 138.65 (C), 160.00 (C), 145.86 (6-CH), 160.11 (3'-C)
ppm. MS-EI: m/z (\%) $277\left(\mathrm{M}^{+37} \mathrm{Cl}, 29\right), 275\left(\mathrm{M}^{+35} \mathrm{Cl}, 100\right)$.
HRMS: Calcd for $\mathrm{C}_{14} \mathrm{H}_{10}{ }^{35} \mathrm{ClNSO}\left[\mathrm{M}^{+}\right]$275.0172. Found 275.0165. Calcd for $\mathrm{C}_{14} \mathrm{H}_{10}{ }^{37} \mathrm{CINSO}$ [ $\left.\mathrm{M}^{+}\right]$277.0142. Found 277.0139.
