1 Introduction

Mallidis et al. in Report Econometric Institute EI2010-39a propose a framework to assist supply chain managers in designing green supply chain networks. To be more specific, they set-up a methodology for estimating the parameters and identifying cost as also environmentally friendly supply chain configurations in a green supply chain network design problem. The applicability of the proposed methodology is examined through the development of a green supply chain network in the South Eastern Europe region.

The purpose of this report is to provide the readers with a comprehensive overview of all data and results of calculations made in Mallidis et al. (2010) on this network.

The rest of the report is organized as follows. In Section 2 the annual demand, expressed in 40ft containers, for the examined products in Bulgaria, Romania and FYROM (also known as Macedonia) is estimated, while in section 3 the gross weight capacity of the examined 40ft container is calculated. In section 4 the leasing as also outsourcing costs of deconsolidation/consolidation operations will be estimated. In Section 5, ship, truck and rail transportation costs are estimated while in section 6 their generated CO₂ and PM emissions are quantified. Finally in Section 7 the supply chain configurations along with the transportation modes utilized for each optimization criterion are analyzed.

2 Estimation of annual demand in the examined countries regions

The estimated annual demand for the examined products (kitchens, micro waves, washing machines and refrigerators) in FYROM, Bulgaria and Romania is based on (i) the estimated annual demand for the examined products in Greece (ii) the ratio of each country's regions GDP to that of Greece and (iii) the volume of a 40ft container (67 m³). Table 1 displays the annual demand for the examined products in Greece, while tables 2 and 3 the estimated monthly demand for the examined products in Bulgaria, Romania and FYROM, assuming that the company satisfies 20% of their total demand.

Table 1: Estimated annual demand (Greece)

Product	Annual (items)	Average volume (m ³)	Annual (40foot)
Refrigerators	444638	0.80	5309
Kitchens	667799	0.41	4087
Micro devices	1895000	0.13	3677
Washing machines	321395	0.41	1967

Table 4: Estimated annual and monthly demand (FYROM)

Regions	Capital cities	Region /Greece GDP	Annual	Monthly (20%)
Skopje	Skopje	0.02815	423	7

3 Estimation of the 40ft container tonnage

Based on (i) typical weight and volume characteristics of washing machines, refrigerators, micro ovens, kitchens and (ii) the volume and weight of an empty 40ft container (approximately 4tons), we have estimated the gross tonnage of the container under study. Table 5 displays the average volume and weight characteristics of the products under study as also the average net tonnage of the examined 40ft container.

Table 5: Estimated average net tonnage

Product	Average volume (m3)	Average Weight	Kgs/m ³ /product	Net tonnage
Refrigerators	0.80	75.0	93.8	6285
Kitchens	0.41	40.0	97.6	6539
Micro devices	0.13	5.0	38.5	2580
Wash. mach.	0.41	75.0	182.9	12254
Average values	0.44	49.0	103.2	6915

4 Estimation of deconsolidation/consolidation costs

The deconsolidation/consolidation costs estimated in this section incorporate (i) the cost of leasing distribution centers (including all daily operational costs of the distribution center) of various capacities in Greece, Bulgaria, Romania and FYROM as also (ii) the cost per TEU for outsourcing deconsolidation/consolidation operations to 3PLs. The monthly leasing and outsourcing costs of deconsolidation/consolidation operations utilized in this work have been estimated based on current prices in Thes/niki (specifically for outsourcing, the cost is €120 per 40ft cntr) retrieved from V.CH. Kampakis Group. For Bulgaria and Romania these costs are approximately 20% lower while for FYROM, 40%. Table 6 displays the leasing costs of various capacity distribution centers in Greece, Bulgaria, Romania and FYROM.

Table 6: Leasing deconsolidation/consolidation costs (euro / month)

Regions \ Storage Capacity (in 40ft cntrs)	60	80	100	200
Greece (Thes/niki)	10000	13000	16500	20000
Bulgaria	8000	10400	13200	16000
Romania	8000	10400	13200	16000
FYROM (Skopje)	6000	7800	9900	12000

5 Calculation of transportation costs

The transportation costs calculated in this section incorporate: (i) Euro III, IV, V and VI heavy duty and delivery truck costs per 40ft container (iii) rail and block train costs per 40ft container.

5.1 Heavy duty truck costs

For the option that involves outsourcing of transportation services, heavy duty truck freight rates per 40 foot containers are estimated based on (i) freight rates per TEU, for specific routes in the Regions of Bulgaria, Romania and FYROM and (ii) an estimated 33% freight rate increase (compared to freight rates per TEU) for 40foot containers (V.CH. Kampakis Group, “Personal Communication”). The distances of the routes have been estimated with the use of the software Euro map route planner and Google earth while cost data have been retrieved from one of the largest (3PLs) in Northern Greece namely Orphee Beinoglou INTL Forwarders SA, “Personal Communication”. Having estimated the distances in these routes along with the corresponding freight rates per 40foot container, we have then developed a regression equation. For the option that involves leasing of transportation services, truck freight rates per 40ft container are estimated to be 20% lower compared to the option that involves outsourcing (V.CH. Kampakis Group, “Personal Communication”) since (a) they are charged based on a fixed long term contract and not on a spot market basis as in outsourcing and (b) no agency fees are included since the examined company has direct communication with the truck owners. The freight rates for Euro IV, V, VI heavy duty trucks are estimated based on their purchase price differences with that of Euro III . To be more specific we consider that 75% of all Euro type truck costs incorporate the truck drivers wages and other operational expenses, such as order costs, truck maintenance costs e.t.c, while 25% the truck depreciation costs. Since the latter is proportional to the trucks purchase costs the 75% of the freight rate is the same for all trucks independently of their engines Euro norm and the rest 25% of the freight rate, changes according to the truck purchase costs that depends on the engines Euro norm. Specifically for Euro VI heavy duty trucks that are not still in use the purchase price involves an estimated value. Finally from the Entry Point to its corresponding Distribution Center, a city limit expense of 100€ is charged.

Table 7 displays the heavy duty truck freight charges per 40ft container for specific routes, while table 8 the purchase costs of the examined Euro trucks (S.Savvatis LTD, “Personal Communication”) along with their percentage freight rate differences. Finally table 9 displays the heavy duty truck freight rates in the routes examined for the options of outsourcing and leasing.

Table 7: Euro III heavy duty truck freight rates

5.2 Delivery truck costs

We consider typical 10 ton delivery trucks with a platform loading capacity of 31 m³ (5 x 2.45 x 2.5). Given delivery truck freight rates (for transporting the estimated payload of 3.2 tons) for various routes in Greece (V.CH. Kampakis Group, “Personal Communication”), we have formulated a regression equation for calculating delivery truck freight rates per 40ft container, for the option of outsourcing (the initial values were adjusted to delivery truck freight rates per 40ft container by multiplying them by 2.2,

which represents the examined 40ft container and delivery truck, volume capacity ratios, 67/31). For the option that involves leasing of delivery truck transportation services, the same reduction in freight rates is considered with that of heavy duty trucks while Euro IV, V and VI delivery truck freight rates are also estimated based on their purchase cost differences with Euro III. Table 10 represents the estimated Euro III delivery truck freight rates per 40ft container in the regions of Greece, while table 11 the purchase costs of Euro IV, V, VI and the percentage purchase cost differences and freight rates with Euro III (S.Savatis LTD). Finally table 12 displays the delivery truck freight rates in the examined routes.

Table 10: Euro III delivery truck freight rates

From	to	Distance (kms)	Cost per 40ft container
Thes/niki	Athens	500	2844
Thes/niki	Xanthi	223	2559
Thes/niki	Kozani	130	2275
Thes/niki	Kilkis	50	1877

The derived regression equation developed for calculating Euro III delivery truck costs per 40ft container is displayed below:

$$y=1.953x + 1948$$

Table 11: Purchase prices of delivery trucks

5.3 Rail costs

Rail costs incorporate (i) the rail freight rate for transporting a 40ft container to its destinations rail depot (ii) the rail freight rate for returning the empty 40ft container (iii) the handling costs at the rail freight depot and (v) the city limit expenses for transporting a 40ft container by truck from the rail depot to its final destination and returning the empty. The parameters required for calculating the rail freight rates per 40ft container incorporate (i) rail freight rate coefficients set, based on different gross weights and types

of containers and (ii) rail freight rate coefficients set, based on the distances of specific routes. These coefficients are then multiplied in order to derive the rail freight rate per 40ft container in the examined routes. The same methodology is adopted for calculating the rail freight rate for returning the empty 40ft container. In this case the first coefficient is the one that corresponds to the lowest 40ft container gross weight category while the second remains same. Finally for every 15 x 40ft containers a block train is deployed that results in a 20% discount compared to the rail freight rates for transporting an individual 40ft container.

Table 13 displays the gross weight and size classification coefficients, while table 14 the additional rail transportation related costs. Finally, table 15 displays the rail and block train freight rates per 40ft container. All data displayed in the following tables have been retrieved from the Greek Railway organizations price lists (TRAINOSE),

Table 13: Weight and size classification coefficients

Container type	Gross weight (g.w.)	Coefficient
20 foot	$g.w. \leq 8t$	0.37
	$8t \leq g.w. \leq 16.5t$	0.45
	$16t \leq g.w. \leq 22.0t$	0.55
	$22t \leq g.w. \leq 34.0t$	0.75
	$34t \leq g.w.$	0.85
40 foot	$g.w. \leq 8t$	0.70
	$8t \leq g.w. \leq 16.5t$	0.75
	$16t \leq g.w. \leq 22.0t$	1.00
	$22t \leq g.w. \leq 34.0t$	1.00
	$34t \leq g.w.$	1.00

Since 40ft containers with a gross weight of 11 tons are considered in this work the weight, size classification coefficient used is 0.75 while the size and weight classification coefficient considered for returning the empty is 0.70

Table 14: Distance coefficients

Cost Breakdown	Cost in €
Handling costs per 40ft container	50
City limit expenses	100
Total costs	150

At this point we must state that no rail depot operates in Prahova and therefore rail transportation is not considered as an option. Additionally for Skopje and considering that there are no direct rail connections between Bulgarian, Romanian and Skopje rail depots we assume that the Distribution Center of Skopje is served by the Entry Points of Varna and Constanta by heavy duty trucks solely.

5.4 Shipping Costs

The shipping costs examined in this case study incorporate: (i) a sea freight rate per 40ft container from Shanghai to Thes/niki, Varna and Constanta respectively (ii) local charges per 40ft container at each Port of destination and (iii) a custom clearance cost per 40ft container. The cost data displayed in table 16 have been also estimated based on shipping costs per TEU, retrieved from Orphee Beinoglou INTL Forwarders S.A, (while considering a 33% increase as in heavy duty trucks freight rates). At this point we must state that the ship freight rates considered may change significantly due to the extremely volatile shipping freight market.

Table 16: Shipping costs per 40ft container in (€)

Cost break down	Thes/niki	Varna	Constanta
Freight rates	1898	2076	2136
Local charges	219	279	271
Custom clearance	200	266	200
Total	2317	2621	2607

6 Transportation Emissions

The transportation emissions calculated in this subsection encapsulate (i) the examined container vessels CO₂ and PM emissions (ii) Euro III, IV, V, VI heavy duty and delivery truck CO₂ and PM emissions and (iii) diesel rail CO₂ and PM emissions.

6.1 Euro III, IV, V, VI heavy duty and delivery truck CO₂ and PM emissions

Euro III heavy duty and delivery truck CO₂ and PM emissions are calculated based on fixed CO₂ and PM emission amounts (Boer, et al., 2008). To be more specific approximately 847 and 0.32 gr/km of CO₂ and PM emissions are produced respectively for heavy duty trucks and 429, 0.28 gr/km for delivery trucks. The same CO₂ emissions amounts will be considered for Euro IV, V, and VI heavy duty and delivery trucks since different Euro-type engines have no effect in terms of CO₂ emissions generated. Regarding PM emissions though, there are significant percentage reductions between Euro III and IV as also Euro V and VI engine types respectively. For the options that involves outsourcing of transportation services the company is not accountable for the PM and CO₂ emissions generated in the return trips of the heavy duty and delivery trucks, since the latter are typically utilized to transport cargo for other companies returning. Therefore the amount of emissions generated in the return haul of the trip will not be considered. On the other hand though the leased heavy duty and delivery trucks are dedicated to serve the examined company, therefore the amount of emissions generated by the empty truck on the return trip will be aggregated. Regarding return emissions and given specific payloads, the fuel consumption of the heavy duty trucks utilized in this work is estimated to decrease by approximately 30% (Coyle. M. 2007). For delivery trucks we consider a 40% difference since the tonnage of the cargo transported represents a

higher percentage of the empty trucks weight compared to heavy duty trucks. Table 17 presents the PM emissions standards for different heavy duty Euro engines. We consider the same emission standards for the medium to heavy duty delivery trucks (10tons) utilized in this work. Table 18 provides fuel consumption data for 44t heavy duty trucks given different payloads while Tables 19 and 20 display the PM and CO₂ emissions performance of different Euro type heavy duty and delivery trucks respectively. Tables 21 and 22 present Euro III heavy duty truck CO₂ emissions and Euro III, IV, V and VI heavy duty truck PM emissions respectively, for the options of outsourcing and leasing. Finally tables 23 and 24 display the CO₂ emissions performance of Euro III delivery trucks, and the PM emissions performance of Euro III, IV, V and VI delivery trucks respectively for the options of outsourcing and leasing.

Table 17: PM emissions standards

Euro types	PMs	Ratio
Euro III	0.1	100%
Euro IV	0.02	20%
Euro V	0.02	20%
Euro VI	0.01	10%

Table 18: Fuel consumption of 44t trucks given different loads

Loads	Consumption l/t/km
Empty (15.76 tons)	0.017
26 tons gross (our truck)	0.015
32 tons gross	0.014
44 tons gross	0.012

Table 19: Euro type heavy duty truck emissions

Euro norm	CO ₂ gr/km (full)	CO ₂ gr/km (empty)	PM gr/km (full)	PM gr/km (empty)
Euro III	847.0	593.0	0.320	0.2240
Euro IV	847.0	593.0	0.064	0.0448
Euro V	847.0	593.0	0.064	0.0448
Euro VI	847.0	593.0	0.032	0.0224

Table 20: Euro type delivery truck emissions

Truck Type	CO ₂ gr/km (full)	CO ₂ gr/km (empty)	PM gr/km (full)	PM gr/km (empty)
Euro III	943.8	566.28	0.616	0.370
Euro IV	943.8	566.28	0.123	0.074
Euro V	943.8	566.28	0.123	0.074

6.2 Rail emissions

Rail CO₂, PM emissions are calculated based on a fixed amount of CO₂ and PM emissions (Ebert, 2005) produced per ton/km transported. Table 25 displays the amount of diesel and electric rail CO₂ and PM emission generated per 40ft container/km while table 26, the amount of CO₂ and PM emissions per 40ft container generated in the routes of the network under study. At this point we must mention that there is no rail connectivity between Thes/niki, Varna and Constanta Entry Points with Prahova as also between Varna and Constanta with Skopje. Additionally rail transportation is not considered from the Entry Point to its corresponding Distribution Center and therefore heavy duty truck transportation is solely utilized (city limit transportation). Finally, electric rail transportation is utilized in the Bulgarian and Romanian railway routes, as also in the route from Thes/niki to Skopje. From Thes/niki to Promachona/Kulata though diesel wagons are utilized. This implies that the emissions generated in all routes from Thes/niki, as presented in table 26, incorporate diesel rail emissions from Thes/niki to Promachona/Kulata (144km distance) and electric rail emissions from Kulata to the final destinations.

Table 25: Diesel rail emissions per 40ft container

Rail	Emissions (g-t/km)		Emissions (g-40ft container/km)	
	CO ₂	PM	CO ₂	PM
Diesel rail	39.58	0.025	435.4	0.275
Electric train	27.91	0.009	307.0	0.099

6.3 Ship emissions

The examined container vessel emissions are calculated based on a fixed amount of CO₂ and PM emissions per ton/km (Ebert, 2005) for (i) 6000 TEU mother vessel and (ii) typical 1500 TEU feeder vessels. The distance between Shanghai to Gioia Tauro and then to the Entry Points of Thes/niki, Varna and Constanta has been calculated with the use of the port to port distance calculator, sea rate com (URL: http://www.searates.com/trade/import_all/).

Table 27 and 28 display the amount of CO₂ and PM emissions, in gr/t/km and gr/40ft cntr/km respectively, generated from the ships under study

Table 27: Ship emissions per 40ft container

Emissions Ship type	Emissions (g-t/km)		Emissions (g-40ft container/km)	
	CO ₂	PM	CO ₂	PM
6000TEU	11.1	0.029	122.1	0.319
1500TEU	12.9	0.033	141.9	0.363

Table 28: Ships CO₂ and PM emissions per 40ft container in the examined routes

From	to	Distance (km)	CO₂ (kg)	PM (gr)
Shanghai	Gioia Tauro	14582	1780	4652
Gioia Tauro	Thes/niki	1287	183	467
Gioia Tauro	Varna	1741	247	632
Gioia Tauro	Constanta	1831	260	665

7 Results

In the following paragraphs this report will provide a detailed analysis of the developed networks. Three tables will be presented that display (i) the 40ft container flows from Shanghai to the Entry Points transported by ship (ii) the 40ft container flows as also transportation means utilized from the Entry Points to the Distribution centers and (iii) the 40ft container flows from the operating Distribution Centers to the Regional Markets transported by delivery trucks.

Remarks

- The Entry Points presented in Table 29 are numbered from 1-3
- The Distribution Centers presented in table 30 are numbered from 1-16
- The Regional Markets presented in table 31 are numbered from 1-15
- R represents rail transportation while BR block trains. T3 represents Euro III heavy duty truck transportation while T6 Euro VI.
- i.e., in option A cost, of table 30 the distribution center of Cluj is served by the entry point of Varna, with 22 containers, through block trains
