

# A new axiomatization of the core on fuzzy NTU games 

Yan-An Hwang<br>Department of Applied Mathematics, National Dong<br>Hwa University

Yu-Hsien Liao<br>Department of Applied Mathematics, National Dong<br>Hwa University

#### Abstract

In this note we show that on the domain of fuzzy NTU games whose core is non-empty, the core is the only solution satisfying non-emptiness, individual rationality and the reduced game property.

[^0]
## 1 Introduction

The theory of fuzzy games started with work of Aubin $(1974,1981)$ where the notions of a fuzzy game and the core of a fuzzy game are introduced. There are two crucial factors in the framework of fuzzy games, the players and their participation levels. Hwang (2007) extends the notion of the reduced game (Davis and Maschler, 1965) to fuzzy games by only reducing the number of the players. Also, inspired by Serrano and Volij (1998), he offers an axiomatization of the core in the context of fuzzy games. Here, we turn to a different definition of the reduced game by reducing both the number of the players and the participation levels. We shall introduce such a reduced game to fuzzy NTU games and define the related reduced game property and its converse. Also, we offer an extension of Peleg (1985)'s axiomatization of the core to fuzzy NTU games.

## 2 Preliminaries

Let $U$ be the universe of players. ${ }^{1}$ If $N \subseteq U$ is a set of players, then a fuzzy coalition is a vector $\alpha \in[0,1]^{N}$. The $i$-th coordinate $\alpha_{i}$ of $\alpha$ is called the participation level of player $i$ in the fuzzy coalition $\alpha$. For all $T \subseteq N$, let $|T|$ be the number of elements in $T$. Instead of $[0,1]^{T}$, we will write $F^{T}$ for the set of fuzzy coalitions. A player-coalition $T \subseteq N$ corresponds in a canonical way to the fuzzy coalition $e^{T}(N) \in F^{N}$, which is the vector with $e_{i}^{T}(N)=1$ if $i \in T$, and $e_{i}^{T}(N)=0$ if $i \in N \backslash T$. The fuzzy coalition $e^{T}(N)$ corresponds to the situation where the players in $T$ fully cooperate (i.e. with participation level 1 ) and the players outsides $T$ are not involved at all (i.e. they have participation level 0). Denote the zero vector in $\mathbb{R}^{N}$ by $0^{N}$. The fuzzy coalition $0^{N}$ corresponds to the empty player-coalition. Note that if no confusion can arise $e^{T}(N)$ will be denoted by $e^{T}$.

Let $\alpha \in F^{N}, A(\alpha, N)=\left\{i \in N \mid \alpha_{i}>0, \alpha \in F^{N}\right\}$ is the set of players who participate in $\alpha$. Let $x, y \in \mathbb{R}^{N} . x \geq y$ if $x_{i} \geq y_{i}$ for all $i \in N$; $x>y$ if $x \geq y$ and $x \neq y ; x \gg y$ if $x_{i}>y_{i}$ for all $i \in N$. We denote $\mathbb{R}_{+}^{N}=\left\{x \in \mathbb{R}^{N} \mid x \geq 0^{N}\right\}$. Let $A \subseteq \mathbb{R}^{N}$. A is comprehensive if $x \in A$ and $x \geq y$ imply $y \in A$. The boundary of $A$ is denoted by $\partial A$, and the interior of $A$ is denoted by int $A$. If $x \in \mathbb{R}^{N}$ then $x+A=\{x+a \mid a \in A\}$.
Definition $1 A$ fuzzy NTU game is a pair $(N, V)$, where $N$ is a nonempty and finite set of players and $V$ is a characteristic function that

[^1]assigns to each fuzzy coalition $\alpha=\left(\alpha_{i}\right)_{i \in N} \in F^{N} \backslash\left\{0^{N}\right\}$ a subset $V(\alpha)$ of $\mathbb{R}^{A(\alpha, N)}$, such that
\[

$$
\begin{equation*}
V(\alpha) \text { is non-empty, closed and comprehensive, } \tag{1}
\end{equation*}
$$

\]

$$
\begin{align*}
& V(\alpha) \cap\left(x+\mathbb{R}_{+}^{A(\alpha, N)}\right) \text { is bounded for every } x \in \mathbb{R}^{A(\alpha, N)},  \tag{2}\\
& \text { if } x, y \in \partial V(\alpha) \text { and } x \geq y \text {, then } x=y \cdot(\text { non-levelness }) \tag{3}
\end{align*}
$$

The core of a fuzzy NTU game ( $N, V$ ) is as follows.
Definition 2 The core $C(N, V)$ of $(N, V)$ consists of all $x \in \partial V\left(e^{N}\right)$ that satisfy for all $\alpha \in F^{N} \backslash\left\{0^{N}\right\},\left(\alpha_{i} x_{i}\right)_{i \in A(\alpha, N)} \notin \operatorname{int} V(\alpha)$.

We denote

$$
\Gamma_{c}=\{(N, V) \mid C(N, V) \neq \emptyset\} .
$$

## 3 Axioms and Reduced Games

A solution on $\Gamma_{c}$ is a function $\sigma$ which associates with each $(N, V) \in \Gamma_{c}$ a subset $\sigma(N, V)$ of $V\left(e^{N}\right)$. Let $(N, V) \in \Gamma_{c}$. Then, a payoff vector $x$ of $(N, V) \in \Gamma_{c}$ is efficient (EFF) if $x \in \partial V\left(e^{N}\right)$; a payoff vector $x$ of $(N, V) \in \Gamma_{c}$ is individually rational (IR) if for all $i \in N$ and for all $j \in(0,1], j x_{i} \notin \operatorname{int} V\left(j e^{\{i\}}\right)$. We will make use of the following axioms:

Let $\sigma$ be a solution on $\Gamma_{c}$. $\sigma$ satisfies non-emptiness (NE) if for all $(N, V) \in \Gamma_{c}, \sigma(N, V) \neq \emptyset . \sigma$ satisfies efficiency (EFF) if for all $(N, V) \in \Gamma_{c}$ and for all $x \in \sigma(N, V), x$ is EFF. $\sigma$ satisfies individual rationality (IR) if for all $(N, V) \in \Gamma_{c}$ and for all $x \in \sigma(N, V), x$ is IR.

We extend to the fuzzy NTU games case the reduced game introduced by Davis and Maschler (1965). Given $x \in \mathbb{R}^{N}$ and $S \subseteq N$, we denote $x_{S} \in \mathbb{R}^{S}$ to be the restriction of $x$ to $S$.
Definition 3 Let $(N, V) \in \Gamma_{c}, x \in \mathbb{R}^{N}, S \subseteq N, S \neq \emptyset$ and $\gamma \in$ $(0,1]^{N \backslash S}$. The reduced game with respect to $S, x$ and $\gamma,\left(S, V_{x, S, \gamma}\right)$, is defined by for all $\alpha \in F^{S} \backslash\left\{0^{S}\right\}$,

$$
\begin{array}{ll}
V_{x, S, \gamma}(\alpha)=\left\{y \in \mathbb{R}^{S} \mid\left(y, x_{N \backslash S}\right) \in V\left(e^{N}\right)\right\} & \text {, if } \alpha=e^{S}(S) \\
V_{x, S, \gamma}(\alpha)=\bigcup_{Q \subseteq N \backslash S}\left\{y \in \mathbb{R}^{A(\alpha, S)} \mid\left(y,\left(\gamma_{i} x_{i}\right)_{i \in Q}\right) \in V\left(\alpha, \gamma_{Q}, 0^{(N \backslash S) \backslash Q}\right)\right\} & \text {, otherwise } .
\end{array}
$$

Note that the condition $\gamma \in(0,1]^{N \backslash S}$ means that when renegotiating the payoff distribution within $S$, the members of $N \backslash S$ will continue to cooperate with the members of $S$. All members in $N \backslash S$ take nonzero levels based on the participation vector $\gamma$ to cooperate.

The reduced game property and its converse are defined as follows:

- Reduced game property (RGP): If $(N, v) \in \Gamma_{c}, S \subseteq N$ with $S \neq \emptyset, \gamma \in(0,1]^{N \backslash S}$ and $x \in \sigma(N, v)$, then $\left(S, V_{x, S, \gamma}\right) \in \Gamma_{c}$ and $x_{S} \in \sigma\left(S, V_{x, S, \gamma}\right)$.
- Converse reduced game property (CRGP): If $(N, v) \in \Gamma_{c}$ with $|N| \geq 3, x \in V\left(e^{N}\right)$, and for all $S \subset N$ with $|S|=2$ and for all $\gamma \in(0,1]^{N \backslash S}$ such that $\left(S, V_{x, S, \gamma}\right) \in \Gamma_{c}$ and $x_{S} \in \sigma\left(S, V_{x, S, \gamma}\right)$, then $x \in \sigma(N, V)$.

## 4 Axiomatization

In this section we shall use NE, IR, and RGP to characterize the core.
Lemma 1 Let $(N, V)$ be a fuzzy NTU game, $x \in V\left(e^{N}\right), S \subseteq N$ with $S \neq \emptyset$, and $\gamma \in(0,1]^{N \backslash S}$. Then the reduced game $\left(S, V_{x, S, \gamma}\right)$ is a fuzzy NTU game.

Proof. It can easily be deduced from the proof of Lemma 3.3 in Peleg (1985).

Lemma 2 Let ( $N, V$ be a fuzzy NTU game, $x \in V\left(e^{N}\right), S \subseteq N$ with $S \neq \emptyset$, and $\gamma \in(0,1]^{N \backslash S}$. Then $x$ is EFF in $(N, V)$ if and only if $x_{S}$ is EFF in the reduced game ( $S, V_{x, S, \gamma}$ ).

Proof. It can easily be deduced from the proof of Lemma 4.4 in Peleg (1985).

Lemma 3 The core satisfies $R G P$.
Proof. It can easily be deduced from the proof of Lemma 4.5 in Peleg (1985).

Lemma 4 The core satisfies CRGP.
Proof. Let $(N, V) \in \Gamma_{c}$ with $|N| \geq 3$ and let $x \in V\left(e^{N}\right)$. Suppose that for all $S \subset N$ with $|S|=2$ and for all $\gamma \in(0,1]^{N \backslash S},\left(S, V_{x, S, \gamma}\right) \in \Gamma_{c}$ and $x_{S} \in C\left(S, V_{x, S, \gamma}\right)$. We will show that $x \in C(N, V)$. Since $x_{S} \in$ $C\left(S, V_{x, S, \gamma}\right), x_{S}$ is EFF in $\left(S, V_{x, S, \gamma}\right)$. Hence $x$ is EFF in $(N, V)$ by Lemma 2. It remains to show that for all $\alpha \in F^{N} \backslash\left\{0^{N}, e^{N}\right\},\left(\alpha_{i} x_{i}\right)_{i \in A(\alpha, N)} \notin$ $\operatorname{int} V(\alpha)$. Assume, on the contrary, that there exists $\alpha \in F^{N} \backslash\left\{0^{N}, e^{N}\right\}$ such that $\left(\alpha_{i} x_{i}\right)_{i \in A(\alpha, N)} \in \operatorname{int} V(\alpha)$. Two cases can be distinguished:
Case 1: $A(\alpha, N)=N$ :
Choose $k \in A(\alpha, N)$ with $\alpha_{k} \neq 1$ ( This can be done since $\alpha \neq e^{N}$ ).

Let $j \in N, j \neq k$, and let $S=\{k, j\}, \gamma=\alpha_{N \backslash S}$. Since $\left(\alpha_{i} x_{i}\right)_{i \in A(\alpha, N)} \in$ $\operatorname{int} V(\alpha)$ and
$V_{x, S, \gamma}\left(\alpha_{k}, \alpha_{j}\right)=\bigcup_{Q \subseteq N \backslash S}\left\{y \in \mathbb{R}^{\{k, j\}} \mid\left(y,\left(\gamma_{i} x_{i}\right)_{i \in Q}\right) \in V\left(\alpha_{\{k, j\}}, \gamma_{Q}, 0^{(N \backslash S) \backslash Q}\right)\right\}$,
by taking $Q=N \backslash S$, we have that $\left(\alpha_{k} x_{k}, \alpha_{j} x_{j}\right) \in \operatorname{int} V_{x, S, \gamma}\left(\alpha_{k}, \alpha_{j}\right)$.
Case 2: $A(\alpha, N) \neq N$ :
Choose $k \in A(\alpha, N)$. Let $j \notin A(\alpha, N)$, and let $S=\{k, j\}$. For convenience, let $T=N \backslash(A(\alpha, N) \cup\{j\})$. Taking $\gamma=\left(\alpha_{A(\alpha, N) \backslash\{k\}}, e^{T}(T)\right)$. Since $\alpha_{j}=0$, by the same arguments as case 1 except taking $Q=$ $A(\alpha, N) \backslash\{k\}$, we can derive that $\alpha_{k} x_{k} \in \operatorname{int} V_{x, S, \gamma}\left(\alpha_{k}, 0\right)$.

Hence, by cases 1 and $2, x_{S} \notin C\left(S, V_{x, S, \gamma}\right)$, the desired contradiction has been obtained.

Lemma 5 Let $\sigma$ be a solution on $\Gamma_{c}$. If $\sigma$ satisfies $I R$ and $R G P$ then it also satisfies EFF.

Proof. It can easily be deduced from the proof of Lemma 5.4 in Peleg (1985).

Lemma 6 If a solution $\sigma$ on $\Gamma_{c}$ satisfies $I R$ and RGP, then for all $(N, V) \in \Gamma_{c}, \sigma(N, V) \subseteq C(N, V)$.

Proof. Let $(N, V) \in \Gamma_{c}$. If $|N|=1$, then by IR of $\sigma$ and $C$, $\sigma(N, v) \subseteq C(N, v)$. If $|N|=2$, by Lemma $5, \sigma$ satisfies EFF. Let $x \in \sigma(N, V)$. It remains to show that for all $\alpha \in F^{N} \backslash\left\{0^{N}, e^{N}\right\}$, $\left(\alpha_{i} x_{i}\right)_{i \in A(\alpha, N)} \notin \operatorname{int} V(\alpha)$. Let $\alpha \in F^{N} \backslash\left\{0^{N}, e^{N}\right\}$. Two cases can be distinguished:
Case 1: $|A(\alpha, N)|=1$ :
We have done by IR of $\sigma$.
Case 2: $|A(\alpha, N)|=2$ :
Assume that $N=\{k, j\}$, and $k \in A(\alpha, N)$ with $\alpha_{k} \neq 1$ (This can be done since $\left.\alpha \neq e^{N}\right)$. Let $\gamma=\alpha_{j} \neq 0$. Consider the reduced game $\left(\{k\}, V_{x,\{k\}, \gamma}\right)$. By RGP of $\sigma, x_{k} \in \sigma\left(\{k\}, V_{x,\{k\}, \gamma}\right)$. Thus, $x_{k} \in$ $C\left(\{k\}, V_{x,\{k\}, \gamma}\right)$. So, $\alpha_{k} x_{k} \notin \operatorname{int} V_{x,\{k\}, \gamma}\left(\alpha_{k}\right)$. Since

$$
V_{x,\{k\}, \gamma}\left(\alpha_{k}\right)=\bigcup_{Q \subseteq\{j\}}\left\{y \in \mathbb{R}^{\{k\}} \mid\left(y,\left(\gamma_{i} x_{i}\right)_{i \in Q}\right) \in V\left(\alpha_{\{k\}}, \gamma_{Q}, 0^{\{j\} \backslash Q}\right)\right\},
$$

by taking $Q=\{j\}$, we have that $\left(\alpha_{k} x_{k}, \alpha_{j} x_{j}\right) \notin \operatorname{int} V\left(\alpha_{k}, \alpha_{j}\right)$.
Hence, by cases 1 and $2, \sigma(N, v) \subseteq C(N, v)$. It remains to consider the case $|N| \geq 3$. Let $x \in \sigma(N, V)$. Since $\sigma$ satisfies RGP, for all $S \subseteq N$ with $|S|=2$ and for all $\gamma \in(0,1]^{N \backslash S}, x_{S} \in \sigma\left(S, V_{x, S, \gamma}\right)$. Hence, $x_{S} \in C\left(S, V_{x, S, \gamma}\right)$. So, $x \in C(N, V)$ by CRGP of the core.

Lemma 7 Let $(N, V) \in \Gamma_{c}$ and $x \in C(N, V)$. There exists $\left(N^{\prime}, V^{\prime}\right) \in$ $\Gamma_{c}$, where $N \subset N^{\prime}$ and $\left|N^{\prime}\right|=|N|+1$ such that $\{(x, 0)\}=C\left(N^{\prime}, V^{\prime}\right)$ and for all $\gamma \in(0,1),\left(N,\left(V^{\prime}\right)_{(x, 0), N, \gamma}\right)=(N, V)$.

Proof. Let $(N, V) \in \Gamma_{c}$ and $x \in C(N, V)$. Let $N^{\prime}=N \cup\{p\}$ where $p \in U \backslash N$. We define a game ( $\left.N^{\prime}, V^{\prime}\right)$ by the following rules: ${ }^{2}$

1. For all $0<u \leq 1$, let $V^{\prime}\left(u e^{\{p\}}\left(N^{\prime}\right)\right)=\left\{z \in \mathbb{R}^{\{p\}} \mid z \leq 0\right\}$.
2. For all $t \in F^{N^{\prime}} \backslash\left\{0^{N^{\prime}}, e^{N^{\prime}}\left(N^{\prime}\right)\right\}$ with $t_{p}=1$, let

$$
V^{\prime}(t)=\left\{z \in \mathbb{R}^{A\left(t, N^{\prime}\right)} \mid \sum_{i \in A\left(t, N^{\prime}\right)} z_{i} \leq \sum_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}} x_{i}\right\} .
$$

3. For all $t \in F^{N^{\prime}} \backslash\left\{0^{N^{\prime}}\right\}$ with $t_{p}=0$, let $V^{\prime}(t)=V\left(t_{N}\right)$.
4. For other $t$, let $a^{A\left(t, N^{\prime}\right)} \in \mathbb{R}^{A\left(t, N^{\prime}\right)}$ be such that $a_{p}^{A\left(t, N^{\prime}\right)}=1$ and $a_{i}^{A\left(t, N^{\prime}\right)}=-1$ for all $i \in A\left(t, N^{\prime}\right) \backslash\{p\}$. Then let

$$
V^{\prime}(t)=\left(V\left(t_{N}\right) \times\{0\}\right)+\left\{u a^{A\left(t, N^{\prime}\right)} \in \mathbb{R}^{A\left(t, N^{\prime}\right)} \mid u \in \mathbb{R}\right\} .^{3}
$$

Next, we prove that $(x, 0) \in C\left(N^{\prime}, V^{\prime}\right)$. Let $y=(x, 0)$. By rule 1 , for all $t$ with $t=u e^{\{p\}}\left(N^{\prime}\right)$ where $0<u \leq 1, t_{p} y_{p}=u \cdot 0=0 \notin \operatorname{int} V^{\prime}(t)$. By rules 2 and $3,\left(t_{i} y_{i}\right)_{i \in A\left(t, N^{\prime}\right)} \notin \operatorname{int} V^{\prime}(t)$ for all $t \in F^{N^{\prime}} \backslash\left\{0^{N^{\prime}}, e^{N^{\prime}}\left(N^{\prime}\right)\right\}$ with $t_{p}=1$ or $t_{p}=0$. It remains to show that for all $t$ in rule 4 , $\left(t_{i} y_{i}\right)_{i \in A\left(t, N^{\prime}\right)} \notin \operatorname{int} V^{\prime}(t)$. Suppose not, then there exists $t$ in rule 4 such that $\left(t_{i} y_{i}\right)_{i \in A\left(t, N^{\prime}\right)} \in \operatorname{int} V^{\prime}(t)$. That is, there exist $\left(t_{i} z_{i}\right)_{i \in A\left(t, N^{\prime}\right)} \in V^{\prime}(t)$ such that $t_{i} z_{i}>t_{i} y_{i}$ for all $i \in A\left(t, N^{\prime}\right)$. Since $t_{p} \neq 0$ and $y_{p}=0, z_{p}>0$. Hence, it follows from rule 4 that $\left(t_{i} z_{i}\right)_{i \in A\left(t, N^{\prime}\right)}=\left(\left(t_{i} w_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}}, 0\right)+$ $u a^{A\left(t, N^{\prime}\right)}$ for some $\left(t_{i} w_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}} \in V\left(t_{N}\right)$ and some $u>0$. But then, $\left(t_{i} w_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}}>\left(t_{i} z_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}}>\left(t_{i} y_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}}=\left(t_{i} x_{i}\right)_{i \in A\left(t, N^{\prime}\right) \backslash\{p\}}$ and hence $x \notin C(N, V)$. This is a contradiction. So, $y \in C\left(N^{\prime}, V^{\prime}\right)$.

To verify the uniqueness, let $z \in C\left(N^{\prime}, V^{\prime}\right)$. By rule $1, z_{p} \geq 0$. By rule $2, z_{i}+z_{p} \geq x_{i}$ for all $i \in N$. By rule 4, there exists $w \in V\left(e^{N}(N)\right)$ such that $z=(w, 0)+\left(\left(-z_{p}\right) e^{N}(N), z_{p}\right)$. Hence, $w_{i}=z_{i}+z_{p} \geq x_{i}$ for all $i \in N$. Since $x \in \partial V\left(e^{N}(N)\right), w_{i}=z_{i}+z_{p}=x_{i}$ for all $i \in N$. Now, if $z_{p}>0$ then $z_{i}<x_{i}$ for all $i \in N$. Since $x \in V\left(e^{N}(N)\right)$, $z_{N} \in \operatorname{intV}\left(e^{N}(N)\right)=\operatorname{int} V^{\prime}\left(e^{N}\left(N^{\prime}\right)\right.$ by rule 3 . This contradicts to that $z \in C\left(N^{\prime}, V^{\prime}\right)$. Hence, $\{(x, 0)\}=\{y\}=C\left(N^{\prime}, V^{\prime}\right)$. It remains to show

[^2]that for all $\gamma \in(0,1),\left(N,\left(V^{\prime}\right)_{y, N, \gamma}\right)=(N, V)$. Let $\gamma \in(0,1)$. Clearly, for all $t$ in rule (4), $\left\{z \in \mathbb{R}^{A\left(t, N^{\prime}\right) \backslash\{p\}} \mid(z, 0) \in V^{\prime}(t)\right\}=V\left(t_{N}\right)$. Combining this with rule (3), we have $\left(N,\left(V^{\prime}\right)_{y, N, \gamma}\right)=(N, V)$ by the definition of $\left(V^{\prime}\right)_{y, N, \gamma}$.
Theorem 1 On $\Gamma_{c}$, the core is the only solution satisfying $N E, I R$ and $R G P$.

Proof. It can easily be deduced from the proof of Theorem 5.5 in Peleg (1985).

The following examples show that each of the axioms used in Theorem 1 is logically independent of the others. These are corresponding to Examples 7.3, 7.4, and 7.5 in Peleg (1985), respectively.

Example 1 Let $\sigma(N, V)=\emptyset$ for all $(N, V) \in \Gamma_{c}$. Then $\sigma$ satisfies $I R$ and RGP, but it violates $N E$.

Example $2 \operatorname{Let} \sigma(N, V)=\partial V\left(e^{N}\right)$ for all $(N, V) \in \Gamma_{c}$. Then $\sigma$ satisfies $N E$ and RGP, but it violates $I R$.

Example 3 Let $\sigma(N, V)=\left\{x \in \partial V\left(e^{N}\right) \mid x\right.$ is $\left.I R\right\}$ for all $(N, V) \in \Gamma_{c}$.
Then $\sigma$ satisfies $N E$ and $I R$, but it violates $R G P$.
