# **Firms and Products in International Trade: Data and Patterns for Hungary**

Gábor Békés – Péter Harasztosi – Balázs Muraközy

## **Abstract**

This paper provides a detailed description of Hungarian trade data and key patterns drawn at the firm and product level. The IEHAS-CEFiG Hungary dataset is an almost universal panel of balance sheet information (1992-2006) merged with firm-product-country level customs data (1992-2003) taken until the 2004 EU accession.

In the Bernard et al. (2007) tradition, statistics describe the prevalence of trading activity, typology of firms by internationalisation, concentration of trade volume within and across sectors as well as geographical features of activities. The aim of this paper is both to offer background statistics to existing studies and to stimulate future research on firms and trade by offering a great deal of descriptive statistics.

After describing datasets, the prevalence of trading activity across sectors, concentration of trading volume across and within sectors, spatial distribution on trade and principal trading partners are described. Stylised facts show that trading activity is heavily concentrated, both exporters and importers show better performance than non-traders, and multi-product and multi-county firms are responsible for the bulk of trade volume.

## **Összefoglaló**

A tanulmány a KTI-CEFIG magyarországi cég- és termékszintű adatbázisa alapján mutatja be a magyar külkereskedelem legfontosabb szerkezeti jellemzőit. Az adatbázis alapja az 1992 és 2006 közötti éves APEH-mérlegekre épülő majdnem teljes körű vállalati panel adatbázis, és a vállalat-termék-ország felbontású vámstasztika, amely az EU-csatlakozás előtti évekre érhető el. Bernard és szerzőtársai tradícióját követve a leíró statisztikák bemutatják a vállalatok és a külkereskedelmi aktivitás jellemzőit, az export- és az importteljesítmény iparági és iparágakon belüli koncentrációját, illetve a kereskedelmi tevékenység földrajzi megoszlását. Célja, hogy a meglévő tanulmányok mellé részletes leíró statisztikákat biztosítson, illetve empirikus mintákat, ötleteket adjon jövőbeni kutatási tervekhez. A tanulmány bemutatja az adatbázis összeállítását, a külkereskedelemben aktív cégek jellemzőit, a külkereskedelem iparági és területi koncentrációját, illetve a termékek és a partnerországok megoszlását. A magyarországi adatok alapján elmondható például, hogy a külkereskedelmi tevékenység jelentős részét viszonylag kis számú cég végzi, az exportáló és az importáló vállalatok termelékenyebbek a külkereskedelemben inaktív cégekhez képest, és a kivitel jelentős részét több terméket több országba exportáló cégek adják.

**Tárgyszavak:** külkereskedelem, export, cég- és termékszintű adatbázis

## 1 Introduction

In the past decade, the appearance of firm level datasets allowed micro-level statistical examination of international trade. Datasets from the US (Bernard et al. 2007), France (Eaton et al. 2005), Italy (Castellani et al. 2008), Belgium (Muûls & Pisu 2007) or Columbia (Eaton et al. 2007) all described the patterns of international trade at the firm level. Empirical trade research based on firm level data point towards the importance of firm heterogeneity and the exceptional performance of the exporting and importing firms, see e.g. Mayer & Ottaviano (2008).

Hungarian data have also been used recently, and this paper is aimed at introducing the key features of the data as well as basic description of the most important patterns of international trade and establishing stylised facts on heterogenous trading firms in Hungary.

The IEHAS-CEFiG Hungary dataset<sup>2</sup> is compiled with the purpose of investigating international trade at the firm level. Balance sheet and customs information for the period 1992-2003 are merged with a firm-product-country panel of manufacturing trade observations. This note is to provide descriptive statistics on this comprehensive dataset focusing on international trade related phenomena: prevalence of trading activity, concentration of trade volume within and across sectors and over space. Furthermore, we give basic inference about the variety of trading partner countries and product categories.

Two datasets from different sources are merged. The first dataset is from the Hungarian Tax Authority (APEH) containing an almost universal sample of firms with double-entry bookkeeping. Data include common balance sheet and income statement information such as output, labour, capital or ownership. Balance sheet data are available for the whole economy. The customs data cover complete set of *transactions* from 1992-2003 taken until Hungary's EU accession in 2004. The observation is an aggregate of shipments at economic entity-destination-product level of export or import naming the country of destination or origin, the value and its physical quantity and product category. Customs data are available for goods (and not services). Importantly, the customs data allowed creating firm-level descriptive variables of trade volume, diversity of trading partners and that of products. These aggregate firm level variables were than directly merged with the balance sheet data.

Manufacturing plays a dominant role in both import and export activity by volume, therefore this discussion focuses on the manufacturing sector.

---

<sup>2</sup>The dataset is used for example in Halpern et al. (2005), Altomonte & Békés (2009), Békés & Muraközy (2008), Csillag & Koren (2009), Békés & Harasztsosi (2009), Görg et al. (2008)

Throughout the paper, we use the following approach to Tables and Statistics. The year 1999 is picked as reference point to describe cross-sectoral distribution of any phenomena; while these tables for 1999 are displayed in the text, time-series of the descriptive statistics will be available in the Appendix.

The rest of the paper is structured as follows. In Section 2, first we describe the two datasets separately and the procedure of merging. Section 3 gives a portrait of trading firms: in 3.1 the prevalence of trading activity across sectors is discussed, part 3.2 investigates how trading firms are different from non-trading firms in terms of key characteristics. Part 3.3 describes the concentration of trading volume across and within sectors. Further, the basic picture on the spatial distribution on trade volume is described. In Section 4 the distribution of the number of traded products are discussed. Using the customs data part 4.2 presents a broader picture on the Hungarian trade regarding products principal trading partners. Finally, some key stylised facts are summarised.

## 2 Constructing the Dataset

In this section we explain in detail how the IEHAS-CEFiG Hungary dataset was constructed: describing both the source dataset and the procedure of merging.

### 2.1 *The source datasets*

The balance sheet database is based on information collected by the Hungarian Tax authority (APEH). It contains information on double entry book keeping firms from 1992 to 2006. The list of key variables include: annual average employment, net value of sales and export sales, fixed assets, wage bill, financial assets, costs of goods and materials. Also, we have information on ownership, as the equity share of the public sector, domestic private sector and foreign owners are given. Firms' sectoral categorisation is identified at four-digit NACE categories (of 1996). The location of the headquarter of the firm is available at municipal level along with its post code, and this allows to describe data spatially at any level of NUTS classification.

The firm level custom dataset is collected by the Hungarian Statistical Office. The dataset is assembled from the customs declarations that economic agents fill out in case they export or import. These account for all transactions entering or leaving Hungary with the special trade approach which excludes

goods stored unaltered in bounded warehouse and duty free zones.<sup>3</sup> In the database yearly trade volumes are reported at destination-firm-product-level. The goods are categorised by the Hungarian Nomenclature of product of 9 digits, which is up-to six digits is equivalent with the Harmonised System categories. As this information is not fully available for us in every year, in this study we will regard each HS6 category as separate product.

The destination or origin of the *transaction* is labelled by two-letter UN country classification, taking the geopolitical changes of the sample period into account. The values of export are calculated as *free on board* and the imports are accounted for on *cost, insurance freight* value in both USD and HUF terms. We are also have information on the physical quantity of an observational unit and its unit of measurement given by the guidelines of Combined Nomenclature. Each observation entails an entity identifier, which is congruent with that of the balance sheet database and which facilitates the merger of the data.

We have no information regarding either the actual APEH id or the name of firms.

## 2.2 Data Cleaning

Some basic cleaning of the APEH dataset was carried out to clean the data of obvious errors. Typos and outliers (such as the use of million instead of thousands, lack of commas, etc.) in wage and employment data were corrected for by looking for abnormally higher than sectoral average changes.

One or two consecutive years of missing information about the sectoral classification of the firm at 4 digit NACE level was corrected for the following way. Gaps were filled with classification of the pre-gap and after-gap classification if those were congruent. Other single gaps were filled with pre-gap observations, unless they were the first observations of a firm. In that case post-gap information was used.

One or two consecutive year gaps of sales, employment, fixed assets, average wage, material cost and foreign share information were filled in with the linear increment suggested by the difference of the pre and post-gap existing information. In case of these variable only single or double gaps were filled where both adjacent information were available. Other gaps were left unaltered.

Of course, users of the data may have added further cleaning depending on

---

<sup>3</sup> Further exclusions are: currency, monetary gold, temporarily used machinery, goods shipped for repairs, international aids, military shipments. From 1997 on only the shipments from duty free zones to abroad were accounted for, those to within Hungary not.

particular usage.

### 2.3 Merger

In order to merge datasets at the firm level, firm-year level aggregates were created such as value of trade in millions of HUF, the number of trading partner countries and the number of traded varieties both for importing and exporting for a given firm. Given the transformation of the customs data, it can be merged to the balance-sheet panel by year and the identifier.

In sum, 26 percent of the export observations (entity-year) and 32 percent of the import observations were not matched for two reasons. First, after the merger firm-year observations that were not originally available in the APEH dataset were dropped. In case of exports this implied on average yearly 5000 observations, showing stability over time. The share of export value dropped in 1992 and 1993 constitute 19% and 14% of the customs export, while in the later years this share is only 3-5%. In case of imports on average 10000 observations are dropped yearly. Similarly to imports in 1992 and 1993 the share of unmatched volume was higher than in later years, being 23 and 19 percent respectively, but only 3 to 5 percents afterwards.

The second discrepancy stems from exporter and importer entities that were not obliged to have double book-keeping by the *Act on Accounting* in effect of the period. This also implies, that by keeping observations present in the APEH data only, we can be more certain, that observations about export and import remaining in IEHAS-CEFiG refer to proper firms.

In this study we use trade information obtained from the customs statistics. Therefore we implicitly assume, that firm that show positive exports in the APEH dataset, but do not appear in the customs data do not trade. That is, we will evaluate exporter status and export volume as suggested by the customs data. This way exporting and importing is handled with the same methodology.

### 2.4 The scope of the IEHAS-CEFiG dataset

Having merged the datasets, a panel ranging from 1992 to 2006 containing 1,246,925 firm-year observations with trade related information until 2003 was obtained. The number of observations ranges from 54 to 136 thousand yearly, as represented by Figure 1.

The sharp drop observed after 1999 is due to the change in the sampling rules used by the data collector. The change affects the sampling of the firms with

less than 5 employee, who thus become underrepresented. The average firm size in terms of employment doubles from 1999 to 2000, from 15 to 30, also total employment in the sample drops only with 7 percent from 1999 to 2000 in the data. The effect of the gap on the trade related inference is minuscule as almost all trading firms are accounted for. Firms with less than million dollars of export are missing after 1999. As less than one percent of 1999 exporters are such firms, this discrepancy can be regarded a minor one. However, it might affect the time-series nature of the data.

Fig. 1. Number of firms by years

The graph shows the yearly number of observations in the IEHAS-CEFiG dataset. The red line represents the change in the sampling procedure from 1999 to 2000.

The cross sectoral distribution of observations shows that more than 70% of firms are in NACE chapters of *Manufacturing, Wholesale and retail trade* and in *Real estate & renting and business activities*. These sectors represent on average 63% of total employment. The relative shares of chapters are stable over time as Table 12 (in the appendix) summarising the employment shares of the NACE chapters over the years confirms. However, one can witness the decline in the relative importance of *Agriculture, Mining and quarrying* and the increase in services such as *Health and Social work, Wholesale and retail trade* and *Education*.

The customs data allow us to evaluate the distribution of trade activity over the sectors. Not surprisingly, the largest share of product exports are performed by the manufacturing firms. Over time their share of export volume increases from 73 percent to 90 percent, as shown by Tables 13 and 14 for the shares of export and import volumes of the various NACE 1 chapters in the Appendix. The largest part of the remaining trade activity is performed by the *Wholesale and retail sector*, though its share is decreasing over time from 17 to 5 percent. Contrary to export volume distribution imports show a bit different picture. While, *Manufacturing* sector is responsible for the majority

Table 1  
Number of observations by NACE chapters

NACE	Observations	share (%)

No info	12227	0.98
<b>TOTAL</b>	<b>1246925</b>	<b>100</b>

share of import volume (50-60 percent) a considerable share of product import (30-40 percent) is carried out through the *Wholesale and retail sector*. While most of this latter import volume consists of products that are sold to consumers directly, some will become inputs to manufacturing firms. The distinction between *Manufacturing* and *Wholesale and Retail* trade is important for example when assessing role of imported inputs of performance of firm or on income distribution of workers.

Given the relative high intensity of trade in the manufacturing sector, the rest of this paper (from Section 3 on) will concentrate on manufacturing firms.

### 2.5 Source discrepancies and representative power of data

This section discusses the representative power of IEHAS-CEFiG dataset regarding the volume of trade. First, we compare the firm level export information from the customs and APEH sources in the merged dataset. Second we compare the customs trade data to the official trade volume aggregate figures published by the Hungarian Statistical Office (KSH).

### 2.5.1 *Two sources of export*

The IEHAS-CEFiG dataset has two sources of exports. One is the balance sheet information from APEH, which contains the volume of export activity that is accounted in the books for a given year. The other source is the merged customs data, which captures all actual transactions. The actual figures from the two sources may be different, because APEH documents only those transactions where change in the ownership occurs, while customs data records transactions irrespective of the ownership status.<sup>4</sup>

A comparison of the two dataset finds a correlation of 0.95 between the export volumes, implying an acceptable difference. However, as shown in Tables 15 and 16 (in the Appendix) the discrepancy varies considerably across sectors and over time. Manufacturing sectors show the highest and most stable correlation with an average of 0.93. The other sectors, with the exception of *Agriculture and Forestry* demonstrate low correlation. If sectors of manufacturing are examined separately, the correlations of the two sources of export data appear strong on average. However sectors, such as *Textiles, Printing and Publishing* and *Radio, television and communication equipment* show average correlation lower than 0.8.

While correlation describes strength of the relationship of the variables it does not assess scale issues. Therefore, in Table 17 the differences in the sums of volumes for a given sector in the given year are examined. The figures express the share volume by which customs data exceeds the book report.<sup>5</sup> While on average, differences are acceptable, in several sectors, especially in *Tobacco products, Wearing apparel* and *Tanning and dressing of leather* larger discrepancies are present.

### 2.5.2 *Representativeness of volume data*

To show the representative power of IEHAS-CEFiG in Table 2 the sums of all export and import values in the data are compared to the official annual product trade volumes published by Hungarian Statistical Office (KSH) . We find that data sums up to 95 - 97 percent of the trade volume thus published. The discrepancy stems from methodological differences. The official figure incorporates some financial services<sup>6</sup> as product trade, while we do not find that in IEHAS-CEFiG.

Also, as indicated by second row for 1996 in Table 2 a methodological change

---

<sup>4</sup> The discrepancy is also influenced by accounting techniques: the accounting and actual exports appear in different years.

<sup>5</sup> If e.g. the figure is 85.7, it suggest that 85 percent of the customs data should be added to the APEH data to make the two sources of data equal.

<sup>6</sup> e.g. such as leasing

Table 2  
Comparison of KSH and IEHAS-CEFiG trade volume data in hundred Bn. HUFs.

	KSH		IEHAS-CEFiG	
	import	export	import	export
1992	8.8	8.4	6.7	6.8
1993	11.6	8.2	9.4	7.0
1994	15.4	11.3	14.0	10.3
1995	19.4	16.2	18.2	15.4
1996	<i>27.6</i>	<i>23.9</i>		
1997	39.6	35.7	37.9	34.6
1998	55.1	49.3	53.7	48.4
1999	66.5	59.4	64.7	58.5
2000	90.6	79.4	86.2	73.0
2001	96.7	87.5	95.1	86.2
2002	97.0	88.7	94.3	87.1
2003	107.0	96.4	104.1	93.5

The trade volumes are in current prices. The second official KSH figures for 1996 (*in italics*) are calculated retrospectively by new method introduced from 1997 on.

occurs at the KSH which broadens 'special trade' category of custom-free areas. Furthermore, the difference also comes from the fact that customs data and KSH treats arm's length and non-arm's length transaction differently. Despite the aforementioned differences, IEHAS-CEFiG created from raw customs transaction level data seems to be able to grasp the majority of Hungarian product trade.

### 3 The Prevalence of Trading Activity at firm level

The key interest in examining firm level datasets on trade activity is that it gives a more detailed picture about what is behind aggregate trade flows and allows us to see whether findings are consistent with trade theories. This section looks at trading firms

#### 3.1 Concentration

Recent stylised facts suggest that trading firms are fairly scarce and there is a very strong concentration of exporting and importing activity at the firm level (see eg. Bernard et al. (2007), Bernard & Jensen (1999)).

To illustrate the propensity to trade of Hungarian manufacturing firms, Table 3 presents the key statics and compares it with results from other countries.

In Hungary, less than third of the firms were exporters and about third were importers in 1999, and the distribution of export and import volumes were both more concentrated than that of sales.

Table 3  
Participation Rate and Concentration: International comparison

	Hungary	Italy	U.S.	Sweden	Belgium
% Exporters	27.7	70.6	27	71	41.2
% Importers	33.2	69.3	14	60	43.2
Gini Exports	0.936	0.825	0.972	.	0.959
Gini Imports	0.945	0.965	0.965	.	0.956
Gini Sales	0.922	0.807	0.916	.	0.873 (VA)
	our paper	Castellani et al. (2008)	Bernard et al. (2007)	Andersson et al. (2007)	Muûls & Pisu (2007)

	all	<i>empl.</i> > 20	all	<i>empl.</i> > 10	all
	manufacturing	manufacturing	manufacturing	manufacturing	manufacturing

Compared to results computed for other countries, Hungary is slightly less open than Belgium, but more open than the U.S. At first glance, Hungarian data may look different to some other countries such as Italy or Sweden. However, this is due to different sampling restrictions used. Knowing from Mayer & Ottaviano (2008) that traders are on average larger in size in Europe, exclusion of small firms results in the overestimation of openness. To be able to compare to Sweden and Italy size adjustment has to be made on our data. For Hungary, the result are as follows. When excluding less than 10 employee firms 55% of the firms export and 59% import. When excluding the less than 20 employee firms results change to 66 and 70 percent respectively. Given these estimates, Hungary seems less open than Sweden, but seems comparable to Italy.

Next, the underlying sectoral distribution of the average 27% export and 33% import participation rate of the manufacturing sector is investigated. Figure 2 shows the share of firms that export in each manufacturing sector plotted against the share that import in 1999. Most open sectors in terms of exports are 34 - *Motor vehicles* (51%), 28 - *Basic and Fabricated metals* (48-30%) and 25 - *Rubber and Plastic products* sector and 24 - *Chemicals* sector both with (41%). The least open sectors in terms of export are the 22 - *Printing and publishing* sector (10%) and 30 - *Office Machinery* sector (16%).

Tables 18 and 19 (in the Appendix) show the export and import participation rate within sectors for all the years of the sample. Remember, that there is a break in the data from 1999 to 2000, the share of traders are systematically higher in the late periods across all sectors due to the lack of small firms. Otherwise trading propensity shows stability over time across sectors.

Sectors with high share of exporters tend to have high share of importers. The

Fig. 2. Share of exporters and importers by sector in 1999

The graph plots the share of exporting firms against the share of importing firms in manufacturing sectors. Each ball represents an industry with the corresponding NACE code indicated on it. Sector 16 of *Tobacco products* is excluded due to the small number of firms, who are all traders.

high correlation of the within sector participation rates is also apparent in Figure 2. This is due to the fact, that most firms perform both exporting and importing activity. Thus for more precise examination of trading activity, four trade status categories have been created. These are the non-trading firms, the firms that import only, firms that export only, and firms that import as well as export (two-way traders). Table 4 shows the share of firms in each status for 1999. It shows, that 38.5% of the firms engage in trading activity, either exporting, importing or both. Five and half percent of the firms on average engage in exporting activity only, on average 11 percent of the firms import only and on average 22.2 percent of the firms engage in both activities. This suggest, that most of the trading manufacturers in the Hungarian economy are two-way traders. There are only some sectors, where share of exporters-only is relatively high e.g. *Wood* and *Basic Metals*.

### 3.2 How different are traders?

Firms engaged in international trade look different along a number of dimension. Since Bernard & Jensen (1999)'s seminal empirical paper on U.S. exporters, several works have documented that firms involved in international trade are different from non-trading firms in many aspects. These firms employ more and better skilled workers, pay higher wages and are more productive than firms selling within borders only. Many of these differences related to the operation of the firms were found and documented both for the U.S. and European countries for example in Bernard et al. (2007) or in Mayer & Ottaviano (2008). These phenomena is also documented for Hungary by Altomonte &

Table 4  
Share of firms in different trade status in sectors of manufacturing 1999, (%)

<i>industry</i>	Num. Obs.	share of			
		non-trader	exp. only	imp. only	two-way trader

All manufacturing	20142	61.3	5.5	11.0	22.2

Békés (2009).

These differences calculated for the IEHAS-CEFiG dataset are summarised in Table 5. Each row displays the average difference between exporter and non-exporters and importers and non-importers in a firm characteristic. The first and the third columns represent ordinary least squares regressions with log of employment, value added per worker, average wage and capital per worker as dependent variables on exporter and importer dummies respectively. The second and fourth columns include employment and sectoral dummies as controls. When employment is the dependent variable employment control is omitted.

As dependent variables are in logs the coefficients can be interpreted as per-

Table 5  
Exporting and importing premia across manufacturers

	exporter premia		importer premia	
	(1)	(2)	(3)	(4)
log of employment	1.525	1.467	1.313	1.276
log of value added per worker	0.388	0.398	0.533	0.524
log of TFP <sup>7</sup>	0.850	0.374	0.947	0.478
log of average wage	0.395	0.255	0.456	0.312
log of capital per worker	0.346	0.477	0.357	0.5
additional covariates	none	sector empl.	none	sector empl.

centage differences. That is, coefficient 1.46 with the log of employment implies:  $\exp(1.46)-1 = 330\%$  higher employment on average in exporter firms. Analogously, other coefficients imply that exporters produce 39 percent more value added per worker, are on average 44 percent more productive, pay 28 percent higher wages and own 47 percent more capital per worker than non-exporting firms. The differences are similar when comparing importers to non-importers, with minor differences: importers have 120% more employment, produce 52% more value added per worker and 47% higher TFP, pay 31% more average wage, are 50% more capital intensive. The performance premium of the traders, either exporters or importers is general, is not caused by outliers. In Figure 3 the cumulative density of log of TFP of non-trading firms is compared to that of exporters and importers. The picture shows that in both cases traders on average outperform non-traders in all deciles of the productivity distribution.

(b) Importers premia

### 3.3 Distribution of trade volume

International research on traders reveals that only a few firms are responsible for most of the trade volume, see e.g. Bernard et al. (2007) or Mayer & Ottaviano (2008). That is, trade volume is highly concentrated. This section describes the distribution of the volume of trade in the Hungarian manufacturing sectors. To provide a general picture, first the evolution of the real trade volume over time is displayed in Figure 4. Both volumes show steady increase in real terms: the average yearly growth of export volume is 19.1 percent, while the corresponding import figure is 23 percent.

Fig. 4. Manufacturing firms direct export and import volume 1992-2003

The graph shows the yearly volume of exports and imports. Both are deflated to 1992 prices and are expressed in billions of HUFs.

The cross sector distribution of manufacturing trade volume is rather unequal. Table 6 summarises the share of each NACE-2 sectors from the volume of export and import in 1999. The major contributor to both import and export volume is the sector 34 of *Motor vehicles*, which is responsible for 23 and 21 percent of the export and import volume respectively. Other main contributing sectors are the *Radio, television and communication* sector with 15 and 18, the *Office machinery and computers* sector with 11 and 11, and the *Electrical machinery* sector with 9 and 8 and percentages shares from the export and import volumes of manufacturing. While other sectors hold only a small share from the volumes, we find that export and import volume shares across sectors are highly correlated. In Figure 5 we plot the share of export volume in a given sector against the share of import volume in the same sector.

In most sectors the bulk of the trading in volume is carried out by a few firms only, and thus trading activity is very concentrated. In 1999 the largest 5 percent of exporters were responsible for 81.5 percent of the total trade, while in case of imports the figure is 84.4%. To further illustrate the extent

Table 6  
Volume shares of manufacturing sectors of exporting and importing in 1999, in (%)

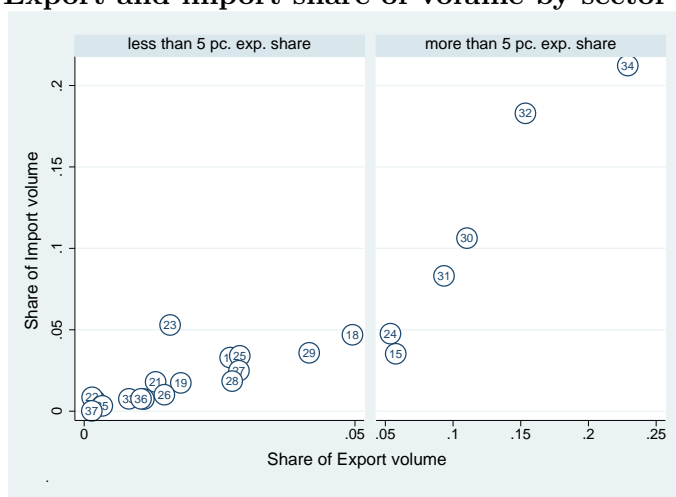

industry	obs.	share of export volume	share of import volume
15 Food products and beverages	2705	5.8	3.5
16 Tobacco products	7	0.2	0.6
17 Textiles	764	2.7	3.3
18 Wearing apparel	1158	5.0	4.7
19 Tanning and dressing of leather	366	1.8	1.7
20 Wood	1244	1.1	0.7
21 Pulp, paper	243	1.3	1.8
22 Publishing, printing	2625	0.1	0.9
23 Coke, refined petroleum	8	1.6	5.3
24 Chemicals, and chemical products	523	5.4	4.8
25 Rubber and plastic products	1059	2.9	3.4
26 Other non-metallic mineral products	764	1.5	1.0
27 Basic metals	233	2.9	2.5
28 Fabricated metal products	2724	2.7	1.8
29 Machinery	1997	4.2	3.6
30 Office machinery and computers	164	11.0	10.6
31 Electrical machinery	708	9.3	8.3
32 Radio, TV and communication equip.	520	15.3	18.3
33 Medical, precision and optical instruments	796	0.8	0.8
34 Motor vehicles	241	22.9	21.2
35 Other transport equipment	127	0.3	0.3
36 Furniture	1059	1.0	0.8
37 Recycling	107	0.1	0.0
TOTALS	20142	100.0	100.0

of this concentration Table 7 presents the share of the largest exporters and importers. Both the export and import block consists of two columns. The first shows the share of the largest 5 percent traders in sectoral trade volume, while the second shows the corresponding figure for the largest 10 percent.

The sectors, where trading volume is most concentrated across exporters are the *Motor vehicles*, *Basic Metals*, and *Pulp and Paper* and *Radio and television* sectors where the top 5 percent are responsible for more than 70 percent of the sectoral trade volume. In case of imports the picture is similar, though *Wood* and *Office Machinery* sectors also appear rather concentrated.

While examining the share of the top exporters and importers in each sector is very illustrative, also Herfindahl indices of concentration were calculated for the better cross section comparison. Tables 22 and 23 present concentration indices in the Appendix confirm previous findings. Patterns of concentration

Fig. 5. **Export and import share of volume by sector in 1999**

The graph plots the share of sectors of total manufacturing export volume of 1999 against the share of corresponding import volume. Each ball represents an industry with the corresponding NACE code indicated on them. For better visibility sectors below and above 5 percent of share of total export volume are graphed separately.

Table 7  
Share of top traders in sectoral trade volume in 1999, (%)

<i>industry</i>	top exporters		top importers	
	5%	10%	5%	10%
15 Food products and beverages	56.6	74.3	67.2	81.0
17 Textiles	58.2	70.6	63.9	75.9
18 Wearing apparel	49.4	65.3	50.7	66.0
19 Tanning and dressing of leather	44.8	60.7	48.4	63.5
20 Wood	65.3	80.2	75.4	87.3
21 Pulp, paper	73.7	89.3	60.7	82.4
22 Publishing, printing	58.3	78.0	69.2	83.3
24 Chemicals, and chemical products	75.3	88.6	70.4	84.6
25 Rubber and plastic products	65.0	80.7	61.0	78.4
26 Other non-metallic mineral products	63.4	79.8	50.0	70.3
27 Basic metals	74.9	88.8	79.0	90.3
28 Fabricated metal products	57.4	71.7	60.5	76.8
29 Machinery	66.5	80.5	68.2	80.6
30 Office machinery and computers	54.8	76.8	76.1	98.5
31 Electrical machinery	60.2	76.2	60.1	77.8
32 Radio, TV and communication equip.	81.6	92.4	77.3	91.6
33 Medical, precision and optical instruments	60.8	81.0	62.3	77.5
34 Motor vehicles	83.2	89.9	87.5	92.8
35 Other transport equipment	55.9	72.7	49.7	72.2
36 Furniture	52.6	70.3	60.2	75.2

The table shows the percentage share of sectoral export/import volume of the 5 and 10 percent of the biggest exporters/importers. Sectors with less than 50 firms are not considered in this listing

are rather stable over time for sectors with low concentration, while a considerable noise is detectable for concentrated sectors. Two key manufacturing industries, *Motor and vehicle* and *Office machinery* show increasing within sector concentration over time, both in terms of export and import volumes. The only sector, that shows considerable decrease in concentration is *Electrical machinery*, where the within sector export Herfindahl index drops from 0.2 to 0.08, suggesting that much more firms got involved in international activities.

### 3.4 Spatial distribution of trade

Though Hungary is a small country both population and economic activity are rather concentrated in space. Almost 40 percent of economic activity takes place in the capital Budapest, which holds about twenty percent of the population and twenty-four percent of the manufacturing employment. The most productive and economically prospering regions are those close to the capital and those in north-west Hungary.

The distribution of economic activity and trade is jointly shaped by that of population, the heritage of communist economic spatial planning and location choice of the incoming FDI in the early-mid 1990's<sup>8</sup>

In Figures 6 spatial distribution of trade volumes per capita are summarised over NUTS-3 level spatial entities of Hungary, which contain the 19 counties (*megye*) and the capital Budapest.

Vas, Győr-Moson-Sopron, Fejér are found to be the leading export and import regions with per capita exports more than 2 million HUFs and per capita imports one and half million. The figures clearly illustrate the west and north bound nature of trading locations. The export volume distribution and also that most importing activity is concentrated towards the western, Austrian border.

While aforementioned geography is driven by volume considerations, another picture can be drawn by looking at the average trade involvement of firms. In Figure 7 the average shares of exports in sales are plotted. Though, the east-west division still dominates, some eastern and southern regions appear rather active in trade such as Baranya and Szolnok counties.

---

<sup>8</sup> As Brulhart & Koenig (2005) find in their examination of post-communist European countries, transition favours regions that are proximate to the large incumbent EU market, both in terms of wages and employment.

Fig. 6. Export and Import per capita by counties in mill. HUFs in 1999

The graphs show the distribution of export (above) and import (below) value per capita in each county in million HUFs for year 1999. The colours deepen towards red with the higher place a region takes in the quintile of the distribution

#### 4 Distribution of Products and Countries

Along with the relative scarcity and concentration of trading volume, recent empirical works on international trade see e.g. Bernard et al. (2007), find

Fig. 7. Firms' average export per sales by counties in 1999

The graph shows the distribution of average share of export in firms' sales in each county in million HUFs for year 1999. The colours deepen towards red with the higher place a region takes in the quintile of the distribution

that there is also a considerable heterogeneity across firms in terms of traded number of products and trading partner countries.

#### 4.1 Products

Many firms trade only one product and with one country, however the larger share of trade in volume is carried out by firms trading many products with many countries. The importance of this observation is at least twofold. Once, it sheds more light on the nature of firm-level concentration of aggregate trade flows. Second, as e.g. Chaney (2008) argues, introducing firm heterogeneity and destination specific fixed-costs to gravity modelling, shows that contrary to the prediction of Krugman-type new trade models adjustments in reaction to increase in trade cost or distance does not all occur on the intensive margin but on the extensive one.

To portrait the characteristics of firms regarding the extensive margin, the number of traded varieties will be defined as the number of HS 6-digit level categories the firm is engaged in foreign trade with. Number of export destinations are the markets served by the firm, while the variety of source countries is used for imports.

Table 8  
Distribution of exporters and Export value by Number of Products and Export Destination 1999

Hungarian manufacturing, export over 60 different products, to over 50 countries, while the most complex importers buy over 200 products types, from over 50 countries. Note that at least 100 firms satisfy each criteria.

In Table 8 the distribution of firms, export volume and employment over

categories of number of products traded and number of countries served is displayed. The table is constructed in the manner of Table 4 in Bernard et al. (2007), however we use wider categories for better description of the underlying distribution. The first block shows, that most firms export only to a single country (44%), furthermore only a single product. The number of firms gradually decrease with an increase in the number of countries or products. Though the single country, single product firms are numerous, their share of export volume and employment is negligible. Multi-product and multi county exporters employ the majority of the exporting workforce and carry out the bulk of the exporting in volume.

Similar exercise is conducted for the analysis of importing activity in Table 9. Firms are more likely to trade with many countries and many product when they import than when they export. Multi county and product importers are responsible for the overwhelming majority of import value (94%) and about three quarters of the employment of all importing firms. These statistics shed light on the importance of export and import platforms of multinational firms that shape Hungarian foreign trade.

When Hungarian result are compared to those obtained for the US in Bernard et al. (2007), one finds that though the share of single-product exporters is similar, share of Hungarian single-country exporters is less. This result may be the consequence of different country sizes and greater set of neighbouring countries. The distribution of employment and export value shows less concentration in Hungary, though the pattern is rather similar.

However examining the extensive margin of trade might not tell us that much about economic decision-making as e.g. Bernard et al. (2007) and many others suggest.

#### *4.2 Countries*

The IEHAS-CEFiG Hungary dataset ranges over a relatively long period of time including periods when fundamental changes took place in the economy. Between 1992 and 2003, Hungarian firms entered a great number of new export markets and a large shift also took place in the direction of exporting from former socialist economies to competitive EU-markets. As for the import origins the top supplier have undergone only a minor change in their order of importance. However, the share of east-asian countries is steadily increasing towards the end of the period. Thanks to liberalisation, increased foreign competition and the collapse of former communist markets, important changes took place in the destination of Hungarian exports and origin of imports.

Hungarian foreign trade involves over hundred countries. If we take a look at

Fig. 8. Partner countries sorted according trade volume in 1999

The figure plots the export and import value traded with partner countries on a log scale. The countries are sorted in a decreasing order with respect to volume from left to right.

the Figure 8 we not only see the largest trading partners, but on the x-axis also a fairly full range export and import partner countries and their corresponding trade volumes. Interestingly, sorted the partners according to trade volume of both export and imports resembles a linear decay on an exponential scale. Focusing currently on the left side of this distribution, Table 27 and Table 28 collect the top 15 trading partners (both in Appendix).

The top export partners are quite stable over time: Germany is in the lead with over 30% of manufacturing export share, followed by Austria and Italy. Indeed, the composition of top 15 export destination has hardly changed overtime.

The collapse of Soviet Union diminishes the importance of the eastward trade. However, the neighbouring former planned economies remain important: these countries play an important role in case of first-time exporters, which may be explained by the lower fixed costs of these markets. To see a more clear picture on the foreign trade with former socialist and communist countries, in Table 31 we display the top exporting partners keeping the pre-transition geopolitical entities. Tables include Soviet Union, Yugoslavia and Czechoslovakia in quotation marks, implying that they were artificially created for comparison purposes as collection of former members.

Using these artificial countries on panel (a) of Figure 9 shows, how the relative importance of important export partners changed from 1992 to 1999. The blue line corresponds to the countries share in trade volume in 1992, the red shows the corresponding 1996 value. The graphs contains countries by their 1992 importance. Due to illustration purposes, Germany is excluded from the graphs. The picture indicates, that Austria, Italy and "Soviet Union" has lost from their former relative importance by 1999, while Netherlands, UK

Fig. 9. Changes in manufacturing trade partner countries 1992 - 1999 and 1999-2003

(a) Early Export changes

(b) Early Import changes

(c) Late Export changes

(d) Late Import changes

and USA show an increased share of exports. On panel (c) the export changes occurred from 1999 to 2003 are plotted.<sup>9</sup> The relative importance of USA and Austria is shown to have been decreasing, while the graphs shows an increase in that of Sweden, Slovakia and France. Changes in the relative position of top export partners are more moderate in the 1999-2003 period.

On the import side Germany is the leading partner also, with around 30% of the manufacturing imports. It is followed by Austria, Russia and Italy with half, third and less of the German share in 1992 and 1999. By 2003 east-asian import becomes dominant, China becomes one of the most prominent suppliers and several other Asian countries (Korea, Malaysia and Taiwan) appear among the top import sources, as Table 28 shows.

Just as in the case of exports, the examination of early period import changes also need to take geopolitical changes into account. On panel (b) of Figure 9 import changes from 1992 to 1999 are plotted. The relative position loss of Austria and "Soviet Union" is visible. Changes in the position of "Soviet Union" and its successor countries means share drop from 13 to 7 percent.

<sup>9</sup> in the later years we do not use the artificial countries

Despite the sharp drop, Russia remains still an important import partner, through oil and gas mainly.

Concerning smaller partners the figure shows a decrease in the relative importance of Switzerland and the Netherlands, and shows a considerable increase in the position of Asian countries. In the later years of our sample the increasing importance of Asia in general and China in particular as global supplier is quite clearly visible in the Hungarian data.

By the end of our sample period former communist countries become important suppliers once again, e.g. an increase in the relative importance of Slovakia, Czech Republic and Poland is indicated by panel (d) of Figure 9.

## 5 Summary

This note gave a basic overview of Hungarian international trade from the point of view of the firms through basic descriptive statistics from a specially compiled database: IEHAS-CEFiG Hungary. Focusing on the manufacturing sector a number of stylised facts has been pointed out about the Hungarian trading firms. These findings are in line with the recent international evidence.

1. Hungary is an open economy where about third of the manufacturing firms export and also about a third of them import, suggesting that in Hungary more firms participate in international trade than in the US or France.
2. Trade volume is very concentrated. The largest five percent of traders in are responsible for more than eighty percent of the export and import volume.
3. Like found in most countries, Hungarian trading firms are different than non trading firms along a number of dimensions. Traders are more productive, employ more than three times as many workers as nontraders, pay higher wages and are more capital intensive.
4. There is a great deal of trade related heterogeneity across firms both regarding exporting and importing activities.
5. Though, a large number of firms sell only a single product or just to a single country, most of Hungarian trade is carried out by multi-product firms trading with many countries.
6. Hungarian trade is concentrated spatially around the capital Budapest and some north-western regions.

## 6 TABLES

Table 10  
A listing of main variables

Variable	Description
id	firm ID
year	Year
nace	NACE 4 digit
sales	Sales*
labor	Employment, average annual
capital	Fixed assets
VA	Value added**
nomcapt	Subscribed capital
forsh	Share of foreign ownership
psh	Share of private ownership
materials	Materials costs
wagebill	Total wagebill paid in a given year
pt	PPI deflator, 1992==1
pe	Export price deflator, 1992==1
ph	Domestic price deflator, 1992==1
totexp	Total exports
totimp	Total imports
numdest	Number of countries firm exports to
numorigin	Number of countries firm imports from
expvarhs6	Export variety in terms different HS6 categories firm exports
impvarhs6	Import variety in terms different HS6 categories firm imports
city	Location of headquarters, city or settlement
kist150	NUTS-4 (150 stratification)
county	NUTS-3 (20)

\*Annual, in Million HUFs, current price as all nominal variables unless otherwise indicated

\*\*Value added is calculated the following way: Before 2001, VA equals Sales plus Capitalised value of self-manufactured assets minus Materials, Cost of goods sold and Other costs. After 2001, Other costs are not subtracted

Table 11  
Number of observations by year and NACE chapters

	1992	1993	1994	1995	1996	1997	1998	1999
