This version: April, 1996

#### Abstract

:

We characterize the prekernel of NTU games by means of consistency, converse consistency, and five axioms of the Nash type on bilateral problems. The intersection of the prekernel and the core is also characterized with the same axioms over the class of games where the core is nonempty.

Keywords: prekernel, NTU games, consistency, converse consistency
Journal of Economic Literature classification Number: C71

[^0]
## 1. Introduction

Paraphrasing Nash (1951), there are two approaches to game theory: axiomatic and strategic. By giving different insights on a problem, the two approaches are complementary. This paper applies the axiomatic approach to the prekernel of games in coalitional form, thereby complementing the strategic analysis that Serrano (1995) made of this solution concept. The extension of the prekernel to games of nontransferable utility (NTU) has been perceived as a challenging problem, and the strategic approach has proven to be useful to this aim. Thus, Serrano (1995) finds that the prekernel is the set of payoffs such that every pair of players' Nash product is critical (Previous attempts to extend the prekernel to NTU games (Kalai (1975), Billera and McLean (1994)) are not satisfactory. Both papers try to extend the notion of a coalition excess to NTU games).

Harsanyi (1959) proposes "reduced games" with respect to pairs of players to analyze "consistency" and "converse consistency" on a class of multi-person pure bargaining problems. In the same spirit as Harsanyi's, we investigate the implications in the model of NTU games of a well-known internal consistency property and its converse with respect to bilateral negotiations as formulated by two-person DavisMaschler (1965) reduced games. Consistency and its converse are the key axioms used by Peleg (1986) in order to characterize the prekernel of transferable utility (TU) games. Roughly speaking, our characterization combines the axioms of Peleg (1986) for the TU prekernel and those of Nash (1950) for the Nash solution to bilateral bargaining problems. In this sense, our work resembles Aumann's (1985) and Hart's (1985) axiomatizations of the Shapley NTU value and the Harsanyi value, respectively. These theorems combine the axioms of Nash (1950) and those of Shapley (1953). Our theorem is also a pure axiomatization, in the sense that it is not restricted to a class where a certain solution concept is nonvacuous. We regard the existence problem and the axiomatic characterization as two completely separate issues. Our main theorem says that, for the class of smooth NTU games, the prekernel is the only solution that satisfies consistency, converse consistency, and a set of five axioms of the Nash type imposed on the subclass of two-person smooth problems ${ }^{1}$ : nonemptiness, scale invariance, equal treatment for TU games, Pareto efficiency, and local independence.

The equal treatment property for TU games is a weaker requirement than Nash's original symmetry axiom. On the other hand, local independence is stronger than the "independence of irrelevant alternatives" axiom. Local independence is introduced and studied by Nagahisa (1991) for the characterization and implementation of the

[^1]Walrasian allocation rule in exchange economies (see also Dutta, Sen and Vohra (1995), Nagahisa and Suh (1995), Saijo, Tatamitani and Yamato (1993)). The basic idea can be traced back to Inada (1964), who proposes this condition to investigate the Arrow impossibility theorem in economic environments. The condition says that "if at a commodity allocation all agents have a common marginal rate of substitution under preference profiles $u$ and $u^{\prime}$, then the allocation should be chosen as a socially optimal outcome for $u^{\prime}$ whenever it is selected for $u$." The version in this paper expresses essentially the same concept in the payoff space.

We also show that for the class of smooth games with the cores nonempty, the same axioms as in our main theorem characterize the intersection of the core and the prekernel. This is related to Moldovanu's (1990) partial axiomatization of this intersection for convex assignment problems.

The paper is organized as follows. Section 2 presents the model, while Section 3 is devoted to the consistency properties of the prekernel. Section 4 contains our main result, as well as examples to show that the axioms are independent.

## 2. The Basic Model

Denote by R the set of the real numbers. If N is a nonempty finite set, denote by $|\mathrm{N}|$ the cardinality of N , and by $\mathrm{R}^{\mathrm{N}}$ the set of all functions from N to R . We identify an element x of $\mathrm{R}^{\mathrm{N}}$ with an $|\mathrm{N}|$-dimensional vector whose components are indexed by members of $N$; thus we write $x_{i}$ for $x(i)$. If $x \in R^{N}$ and $S \subset N$, we write $x_{S}$ the restriction of $x$ to $S$, which is the element of $R^{S}$ that associates $x_{i}$ with each $i \in S$. Let $S \subset N$, and $Y \subset R^{S}$. We define _Y $=\{y \in Y \mid$ There is no $x \in$ Y such that $\mathrm{x}_{\mathrm{i}}>\mathrm{y}_{\mathrm{i}}$ for all $\left.\mathrm{i} \in \mathrm{S}\right\}$, and intY as the interior of Y . A representation for Y is a function g from $\mathrm{R}^{\mathrm{S}}$ to R such that $\mathrm{Y}=\left\{\mathrm{x} \in \mathrm{R}^{\mathrm{S}} \mid \mathrm{g}(\mathrm{x})^{2} 0\right\}$ and int $\mathrm{Y}=$ $\left\{x \in R^{S} \mid g(x)<0\right\}$. We also write $g_{i}(x)$ for the partial derivative of $g$ at $x \in R^{S}$ with respect to component $i \in S$, and $\nabla g(x)$ for the gradient vector of $g$ at $x \in R^{S}$.

The pair ( $\mathrm{N}, \mathrm{V}$ ) is a coalitional game, or simply a game if N is a nonempty finite set, and V is a correspondence that associates with every $\mathrm{S} \subset \mathrm{N}$ a nonempty subset $\mathrm{V}(\mathrm{S})$ of $\mathrm{R}^{\mathrm{S}}$ such that
(1) $\mathrm{V}(\mathrm{S})$ is closed, and comprehensive;
(2) for each $\mathrm{x}_{\mathrm{S}} \in \mathrm{R}^{\mathrm{S}}, \quad \mathrm{V}(\mathrm{S}) \cap\left(\left\{\mathrm{x}_{S}\right\}+\mathrm{R}_{+}{ }^{\mathrm{S}}\right)$ and $\_\mathrm{V}(\mathrm{S}) \cap\left(\left\{\mathrm{x}_{S}\right\}-\mathrm{R}_{+}{ }^{\mathrm{S}}\right)$ are compact; and
(3) for each $\left(x_{S}, y_{S}\right) \in V(S) \times_{-} V(S), x_{S}=y_{S}$ if $x_{S}{ }^{3} y_{S}$ (nonlevelness) ${ }^{2}$.

Let $\mathrm{V}(\mathrm{N})$ be the class of correspondences V such that all ( $\mathrm{N}, \mathrm{V}$ ) are games. A member of N is a player, and a nonempty subset of N is a coalition in the game $(\mathrm{N}$, V ). A payoff to player i is a point of $\mathrm{R}^{\{\mathrm{i}\}}$, and a payoff profile on coalition S is a point of $\mathrm{R}^{\mathrm{S}}$.

The game ( $\mathrm{N}, \mathrm{V}$ ) is smooth if there is a differentiable representation g for $\mathrm{V}(\mathrm{N})$ with positive gradients on $\quad \mathrm{V}(\mathrm{N})$; namely for each $\mathrm{i} \in \mathrm{N}, \mathrm{g}_{\mathrm{i}}(\mathrm{x})>0$ at any $\mathrm{x} \in$ ${ }^{-} \mathrm{V}(\mathrm{N})$. A class $\Gamma$ of games is rich if for every $(\mathrm{N}, \mathrm{V}) \in \Gamma, \Gamma$ contains all two-person games in which the players are members of N .

A transferable utility game, or simply a $T U$ game, is a smooth game ( $\mathrm{N}, \mathrm{V}$ ) which is defined by a function v that associates with every coalition S a real number
 notation, and use ( $\mathrm{N}, \mathrm{v}$ ) to denote the associated coalitional game.

Let $\Gamma$ be a nonempty class of games. A solution on $\Gamma$ is a relation $\sigma$ which associates with every $(\mathrm{N}, \mathrm{V}) \in \Gamma$ a subset $\sigma(\mathrm{N}, \mathrm{V})$ of $\mathrm{V}(\mathrm{N})$ (could be empty).

Definition. Let (\{i, j\}, V) be a two-person smooth game. The prekernel of (\{i, j\}, V) is:

$$
\operatorname{Prk}(\{i, j\}, V)=\left\{x \in \_V(\{i, j\}) \mid g_{i}(x)\left(x_{i}-v_{i}\right)=g_{j}(x)\left(x_{j}-v_{j}\right)\right\},
$$

where $g$ is a representation for $V(\{i, j\})$, and $\left(v_{i}, v_{j}\right)=(\operatorname{maxV}(\{i\}), \operatorname{maxV}(\{j\}))$.

Remark 2.1. Solution Prk reduces to the Nash bargaining solution on the class of two-person smooth games ( $\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}$ ) such that $\mathrm{V}(\{\mathrm{i}, \mathrm{j}\})$ is a convex set containing $\left(\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)$.

Definition. Let $\Gamma$ be a nonempty class of games. Then a solution $\sigma$ on $\Gamma$ satisfies nonempty-valuedness $(\boldsymbol{N E V})$ if $\sigma(\mathrm{N}, \mathrm{V}) \_\varnothing$ for each $(\mathrm{N}, \mathrm{V}) \in \Gamma$; and Pareto efficiency $(\boldsymbol{P E})$ if $\sigma(\mathrm{N}, \mathrm{V}) \subset \__{\mathrm{V}}(\mathrm{N})$ for each $(\mathrm{N}, \mathrm{V}) \in \Gamma$.

Remark 2.2. On the class of two-person smooth games, Prk satisfies NEV and PE.

Let ( $\mathrm{N}, \mathrm{v}$ ) be a TU game, and $\mathrm{i}, \mathrm{j}$ be two distinct players in N . Then i and j are substitutes in $(\mathrm{N}, \mathrm{v})$ if $\mathrm{v}(\mathrm{S} \cup\{\mathrm{i}\})=\mathrm{v}(\mathrm{S} \cup\{\mathrm{j}\})$ for all $\mathrm{S} \subset \mathrm{N} \backslash\{\mathrm{i}, \mathrm{j}\}$.

Definition. Let $\Gamma$ be a class of games. A solution $\sigma$ on $\Gamma$ satisfies the equal treatment property (ETP) for TU games if for each $\mathrm{x} \in \sigma(\mathrm{N}, \mathrm{v}), \mathrm{x}_{\mathrm{i}}=\mathrm{x}_{\mathrm{j}}$ whenever $(\mathrm{N}$, v ) is a TU game in $\Gamma$, and i and j are substitutes in ( $\mathrm{N}, \mathrm{v}$ ).

Remark 2.3. On the class of two-person smooth games, Prk satisfies ETP for TU games.

Let ( $\mathrm{N}, \mathrm{V}$ ) be a game, $\alpha \in \mathrm{R}_{++}{ }^{\mathrm{N}}$, and $\beta \in \mathrm{R}^{\mathrm{N}}$. For each coalition S , we define the function $\lambda_{S}{ }^{\alpha \beta}$ from $R^{S}$ to itself by $\lambda_{S}{ }^{\alpha \beta}\left(x_{S}\right)=\left(\alpha_{i} x_{i}+\beta_{i}\right)_{i \in S}$; for each $x_{S}$
$\in R^{S}$. We then consider $\lambda^{\alpha \beta}(V)$ as the correspondence that associates with every coalition $S$ a set $\lambda^{\alpha \beta}(V)(S)=\left\{y_{S} \in R^{S} \mid y_{S}=\lambda_{S}{ }^{\alpha \beta}\left(x_{S}\right)\right.$ for some $\left.x_{S} \in V(S)\right\}$.

Definition. Let $\Gamma$ be a class of games. A solution $\sigma$ on $\Gamma$ satisfies scale invariance $(S I V)$ if for each $(\mathrm{N}, \mathrm{V}) \in \Gamma$, each $\alpha \in \mathrm{R}_{++}{ }^{\mathrm{N}}$, and each $\beta \in \mathrm{R}^{\mathrm{N}}, \sigma\left(\mathrm{N}, \lambda^{\alpha \beta}(\mathrm{V})\right)=$ $\lambda_{\mathrm{N}}{ }^{\alpha \beta}(\sigma(\mathrm{N}, \mathrm{V}))$ whenever $\sigma(\mathrm{N}, \mathrm{V}){ }_{\mathrm{L}}$ Ø.

Remark 2.4. On the class of two-person smooth games, Prk satisfies SIV.

Definition. Let $\Gamma$ be a nonempty class of two-person smooth games. A solution $\sigma$ on $\Gamma$ satisfies local independence $($ LID $)$ if for each $(\{i, j\}, V) \in \Gamma$, each $x \in \sigma(\{i, j\}$, $\mathrm{V})$, and each $\mathrm{V}^{\prime} \in \mathrm{V}(\{i, j\})$,

$$
\begin{aligned}
& x \in \partial V(\{i, j\}) \cap \partial V^{\prime}(\{\mathrm{i}, \mathrm{j}\}) ; \\
& (\operatorname{maxV}(\{\mathrm{i}\}), \max \mathrm{V}(\{\mathrm{j}\}))=\left(\max \mathrm{V}^{\prime}(\{\mathrm{i}\}), \max \mathrm{V}^{\prime}(\{\mathrm{j}\})\right) ; \\
& \nabla \mathrm{g}(\mathrm{x}) / / \nabla \mathrm{g}^{\prime}(\mathrm{x})^{2} \\
& \Rightarrow \quad \mathrm{x} \in \sigma\left(\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}^{\prime}\right),
\end{aligned}
$$

where $g$ and $g^{\prime}$ are respectively representations for $V(\{i, j\})$ and $V^{\prime}(\{i, j\})$.

Remark 2.5. On the class of two-person smooth games, Prk satisfies LID.

Remark 2.6. Let ( $\mathrm{N}, \mathrm{V}$ ) be a smooth game. Suppose that there is a smooth economy ( $\mathrm{N}, \mathrm{Z}, \mathrm{A}, \mathrm{u}$ ) which generates the outcomes of V as the utility possibility sets of coalitions: Z is a common consumption set for all the agents in N , A is a correspondence that associates with every coalition $S$ a nonempty subset $A(S)$ of $Z$, which denotes the set of feasible allocations for coalition $S$, and $u=\left(u_{i}\right)_{i \in N}$ is a profile of agent's utility functions which are defined on Z and differentiable in its interior. ${ }^{2}$

For each coalition $S$, define the function $u_{S}$ by the Cartesian product of $u_{i}, i \in$ $S$. Then $\mathrm{V}(\mathrm{S})$ is derived as the image $\mathrm{u}_{S}\left(\mathrm{~A}(\mathrm{~S})\right.$ ) of $\mathrm{A}(\mathrm{S})$ under $\mathrm{u}_{\mathrm{S}}$. For each utility profile x on $\partial \mathrm{V}(\mathrm{N})$, the gradient vector of $\partial \mathrm{V}(\mathrm{N})$ at x can be shown to be proportional to the vector of marginal utilities of all the agents with respect to any commodity. Its direction is then unique up to any transformations of utility functions such that the marginal utility vectors of all the agents change proportionally.

Let E be a nonempty class of smooth economies. For each $(\mathrm{N}, \mathrm{Z}, \mathrm{u}, \mathrm{A}) \in \mathrm{E}$, denote by $\mathrm{U}(\mathrm{N}, \mathrm{Z}, \mathrm{A})$ the class of utility functions $\mathrm{u}^{\prime}$ such that $\left(\mathrm{N}, \mathrm{Z}, \mathrm{u}^{\prime}, \mathrm{A}\right) \in \mathrm{E}$. An allocation rule on E is a relation $\varphi$ that associates with every $(\mathrm{N}, \mathrm{Z}, \mathrm{u}, \mathrm{A}) \in \mathrm{E}$ a subset $\varphi(\mathrm{N}, \mathrm{Z}, \mathrm{u}, \mathrm{A})$ of $\mathrm{A}(\mathrm{N})$. The Pareto rule on E is the allocation rule P that assigns to every $(N, Z, u, A) \in E$ the set $P(N, Z, u, A)$ of Pareto efficient allocations
in $\mathrm{A}(\mathrm{N})$. We may thus translate the above version of local independence for the payoff space to that for the commodity space as follows:

An allocation rule $\varphi$ on E satisfies local independence if for each $(\mathrm{N}, \mathrm{Z}, \mathrm{u}, \mathrm{A}) \in$ E, each $z \in \varphi(N, Z, u, A) \cap i n t Z$, and each $u^{\prime} \in U(N, Z, A)$,

$$
\begin{aligned}
& \mathrm{z} \in \mathrm{P}(\mathrm{~N}, \mathrm{Z}, \mathrm{u}, \mathrm{~A}) \cap \mathrm{P}\left(\mathrm{~N}, \mathrm{Z}, \mathrm{u}^{\prime}, \mathrm{A}\right) ; \\
& \operatorname{supu}_{\mathrm{i}}(\mathrm{~A}(\mathrm{i}))=\operatorname{supu}_{\mathrm{i}}^{\prime}(\mathrm{A}(\mathrm{i})), \mathrm{u}_{\mathrm{i}},(\mathrm{z})=\mathrm{u}_{\mathrm{i}},{ }^{\prime}(\mathrm{z}) \text { for every } \mathrm{i} \in \mathrm{~N} ; \\
& \nabla \mathrm{u}(\mathrm{z}) / / \nabla \mathrm{u}^{\prime}(\mathrm{z}) \\
& \Rightarrow \quad \mathrm{z} \in \varphi\left(\mathrm{~N}, \mathrm{Z}, \mathrm{u}^{\prime}, \mathrm{A}\right),
\end{aligned}
$$

were $\nabla \mathrm{u}(\mathrm{z})=\left(\nabla \mathrm{u}_{\mathrm{i}}(\mathrm{z})\right)_{\mathrm{i} \in \mathrm{N}}$, and $\nabla \mathrm{u}^{\prime}(\mathrm{z})=\left(\nabla \mathrm{u}_{\mathrm{i}}^{\prime}(\mathrm{z})\right)_{\mathrm{i} \in \mathrm{N}}$.
This is not identical with the original one by Nagahisa (1991). He does not put on the conditional part either the restrictions of Pareto efficiency or the invariance of utilities. Further the proportionality implies more than the invariance of marginal rates of substitutions. The above requirement is thus weaker than his one.

Proposition 1. Let $\Gamma^{\{i, j\}}$ be the class of two-person smooth games ( $\left.\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}\right)$. Then a solution on $\Gamma^{\{\mathrm{i}, \mathrm{j}\}}$ satisfies NEV, PE, ETP for TU games, SIV, and LID if and only if it is Prk.

Proof. The solution Prk on $\Gamma^{\{\mathrm{i}, \mathrm{j}\}}$ satisfies NEV, PE, ETP for TU games, SIV, and LID. Now we prove the uniqueness. Say $\mathrm{i}=1$, and $\mathrm{j}=2$. Let ( $\{1,2\}, \mathrm{V}$ ) be a twoperson smooth game, and $\sigma$ a solution on $\Gamma\{\mathrm{i}, \mathrm{j}\}$ which satisfies NEV, PE, ETP for TU games, SIV, and LID. We prove that $\sigma(\{1,2\}, \mathrm{V})=\operatorname{Prk}(\{1,2\}, \mathrm{V})$.

By NEV, there exists $x=\left(x_{1}, x_{2}\right) \in \operatorname{Prk}(\{1,2\}, V)$. By PE, $x \in \partial V(\{1,2\})$. By differentiability, there is a unique tangent line of the curve $\quad \mathrm{V}(\{1,2\})$ at $\mathrm{x}: \nabla \mathrm{g}(\mathrm{x}) \cdot(\mathrm{z}-$ $\mathrm{x})=\mathrm{g}_{1}(\mathrm{x})\left(\mathrm{z}_{1}-\mathrm{x}_{1}\right)+\mathrm{g}_{2}(\mathrm{x})\left(\mathrm{z}_{2}-\mathrm{x}_{2}\right)=0$. Define the two-person smooth game $(\{1,2\}$, $\left.V^{\prime}\right)$ by $V^{\prime}(\{1\})=V(\{1\}), V^{\prime}(\{2\})=V(\{2\})$, and $V^{\prime}(\{1,2\})=\left\{z \in R^{\{1,2\}} \mid \nabla g(x) \cdot(z-\right.$ $\left.x^{2}{ }^{2} 0\right\}$. Then, by the LID of Prk, $x \in \operatorname{Prk}\left(\{1,2\}, V^{\prime}\right)$. Note that $\operatorname{Prk}\left(\{1,2\}, \mathrm{V}^{\prime}\right)=\left\{\left(\left[\left(\mathrm{g}_{2}(\mathrm{x}) / \mathrm{g}_{1}(\mathrm{x})\left(\mathrm{x}_{2}-\mathrm{v}_{2}{ }^{\prime}\right)+\mathrm{x}_{1}+\mathrm{v}_{1}{ }^{\prime}\right] / 2,\left[\left(\mathrm{~g}_{1}(\mathrm{x}) / \mathrm{g}_{2}(\mathrm{x})\left(\mathrm{x}_{1}-\mathrm{v}_{1}{ }^{\prime}\right)+\mathrm{x}_{2}+\mathrm{v}_{2}{ }^{\prime}\right] / 2\right)\right\}\right.\right.$, which is the midpoint of the segment on the line $\mathrm{V}^{\prime}(\{1,2\})$ truncated by $\left(\mathrm{v}_{1}{ }^{\prime}, \mathrm{v}_{2}{ }^{\prime}\right)=$ $\left(\max \mathrm{V}^{\prime}(\{1\}), \max \mathrm{V}^{\prime}(\{2\})\right)$. Hence, $\{\mathrm{x}\}=\operatorname{Prk}\left(\{1,2\}, \mathrm{V}^{\prime}\right)\left(\right.$ see Figure 1). ${ }^{2}$ Define the TU game $\left(\{1,2\}\right.$, w) by $\mathrm{w}(\{1\})=0=\mathrm{w}(\{2\})$, and $\mathrm{w}(\{1,2\})=\mathrm{g}_{1}(\mathrm{x})\left(\mathrm{x}_{1}-\mathrm{v}_{1}{ }^{\prime}\right)+$ $g_{2}(x)\left(x_{2}-v_{2}{ }^{\prime}\right)$. By NEV, PE and ETP for TU games, $\sigma(\{1,2\}, w)=\{(1 / 2) w(\{1,2\})$, $(1 / 2) \mathrm{w}(\{1,2\})\}$. Let $\alpha=\left(1 / \mathrm{g}_{1}(\mathrm{x}), 1 / \mathrm{g}_{2}(\mathrm{x})\right)$, and $\beta=\left(\mathrm{v}_{1}{ }^{\prime}, \mathrm{v}_{2}{ }^{\prime}\right)$. By SIV,

$$
\begin{aligned}
& \sigma(\{1,2\}, \lambda \alpha \beta(w))=\lambda_{\mathrm{N}} \alpha \beta(\sigma(\{1,2\}, \mathrm{w})) \\
& \left.=\left\{\left(\left(1 / 2 \mathrm{~g}_{1}(\mathrm{x})\right) \mathrm{w}(\{1,2\})+\mathrm{v}_{1^{\prime}},\left(1 / 2 \mathrm{~g}_{2}(\mathrm{x})\right) \mathrm{w}(\{1,2\})+\mathrm{v}_{2}{ }^{\prime}\right)\right)\right\} \\
& =\operatorname{Prk}\left(\{1,2\}, \mathrm{V}^{\prime}\right)=\{\mathrm{x}\} .
\end{aligned}
$$

[^2]Note that $\left(\{1,2\}, \lambda^{\alpha \beta}(w)\right)$ is the game $\left(\{1,2\}, V^{\prime}\right)$. Hence, $\sigma\left(\{1,2\}, V^{\prime}\right)=\sigma(\{1,2\}$, $\left.\lambda^{\alpha \beta}(w)\right)=\{x\}$, so that $x \in \sigma\left(\{1,2\}, V^{\prime}\right)$. By LID, $x \in \sigma(\{1,2\}, V)$. Thus, $\operatorname{Prk}(\{1,2\}$, $\mathrm{V}) \subset \sigma(\{1,2\}, \mathrm{V})$. In exactly the same way, we can show that $\sigma(\{1,2\}, \mathrm{V}) \subset \operatorname{Prk}(\{1$, $2\}, V)$. Hence, $\sigma(\{1,2\}, V)=\operatorname{Prk}(\{1,2\}, V)$.

## 3. Reduced Game Properties of the Prekernel

The following is a two-person "reduced game" studied by Peleg (1986, 1992). Let $\Pi^{N} \equiv\{P \subset N| | P \mid=2\}$, which is the set of two-person coalitions in $N$.

Definition. Let ( $\mathrm{N}, \mathrm{V}$ ) be a game, $\mathrm{x} \in \mathrm{V}(\mathrm{N})$, and $\mathrm{P} \in \Pi^{\mathrm{N}}$. The two-person reduced game of ( $\mathbf{N}, \mathbf{V}$ ) with respect to $\mathbf{P}$ given $\mathbf{x}$ is the pair $\left(\mathrm{P}, \mathrm{V}_{\mathrm{x}}\right)$ of P and the correspondence $\mathrm{V}_{\mathrm{xP}}$ that associates with every $\mathrm{S} \subset \mathrm{P}$ a subset $\mathrm{V}_{\mathrm{xP}}(\mathrm{S})$ of $\mathrm{R}^{\mathrm{S}}$, where $\mathrm{V}_{\mathrm{xP}}(\{\mathrm{i}\})=\left\{\mathrm{y}_{\mathrm{i}} \in \mathrm{R}^{\{i\}} \mid\left(\mathrm{y}_{\mathrm{i}}, \mathrm{x}_{\mathrm{Q}}\right) \in \mathrm{V}(\{\mathrm{i}\} \cup \mathrm{Q}), \mathrm{Q} \subset \mathrm{N} \backslash \mathrm{P}\right\}$ for each $\mathrm{i} \in \mathrm{P}$, and $\mathrm{V}_{\mathrm{xP}}(\mathrm{P})=$ $\left\{y_{p} \in R^{p} \mid\left(y_{p}, x_{-p}\right) \in V(N)\right\} .{ }^{34}$

Definition. Let ( $\mathrm{N}, \mathrm{V}$ ) be a game. The prekernel of $(\mathbf{N}, \mathbf{V})$ is:
$\operatorname{Prk}(N, V)=\left\{x \in{ }_{-} V(N) \mid g_{i}(x)\left(x_{i}-v_{i}\left(x_{-\{i, j}\right\}\right)\right)=g_{j}(x)\left(x_{j}-v_{j}\left(x_{-\{i, j}\right)\right)$ for each $\left.\mathrm{i}, \mathrm{j} \in \mathrm{N}\right\}$, where $g$ is a representation for $V(N)$, and $\left.\left.v_{i}\left(x_{-\{i, j}\right)\right), v_{j}\left(x_{-\{i, j\}}\right)\right)=\left(\max _{x\{i, j\}}(\{i\})\right.$, $\left.\max V_{x\{i, j}(\{j\})\right)$.

Definition. Let $\Gamma$ be a nonempty class of smooth games. A solution $\sigma$ on $\Gamma$ satisfies local independence $($ LID $)$ if for each $(\mathrm{N}, \mathrm{V}) \in \Gamma$, each $\mathrm{x} \in \sigma(\mathrm{N}, \mathrm{V})$, and each $\mathrm{V}^{\prime} \in$ V(N),

$$
\begin{aligned}
& \mathrm{x} \in \partial \mathrm{~V}(\mathrm{~N}) \cap \partial \mathrm{V}^{\prime}(\mathrm{N}) ; \\
& \forall \mathrm{P} \in \Pi^{\mathrm{N}}, \forall \mathrm{Q} \subset \mathrm{~N} \backslash \mathrm{P}, \forall \mathrm{i} \in \mathrm{P}, \mathrm{v}_{\mathrm{i}}\left(\{\mathrm{i}\} \cup \mathrm{Q} ; \mathrm{x}_{\mathrm{Q}}\right)=\mathrm{v}_{\mathrm{i}}^{\prime}\left(\{\mathrm{i}\} \cup \mathrm{Q} ; \mathrm{x}_{\mathrm{Q}}\right) \\
& \nabla \mathrm{g}(\mathrm{x}) / / \nabla \mathrm{g}^{\prime}(\mathrm{x})
\end{aligned}
$$

$$
\Rightarrow \quad x \in \sigma\left(N, V^{\prime}\right)
$$

where $g$ and $g^{\prime}$ are respectively representations for $V(N)$ and $V^{\prime}(N), v_{i}\left(\{i\} \cup Q ; x_{Q}\right)=$ $\max \left\{\mathrm{y}_{\mathrm{i}} \in \mathrm{R}\{\mathrm{i}\} \mid\left(\mathrm{y}_{\mathrm{i}}, \mathrm{x}_{\mathrm{Q}}\right) \in \mathrm{V}(\{\mathrm{i}\} \cup \mathrm{Q})\right\}$, and $\mathrm{v}_{\mathrm{i}}{ }^{\prime}\left(\{\mathrm{i}\} \cup \mathrm{Q} ; \mathrm{x}_{\mathrm{Q}}\right)=\max \left\{\mathrm{y}_{\mathrm{i}} \in \mathrm{R}\{\mathrm{i}\} \mid\left(\mathrm{y}_{\mathrm{i}}, \mathrm{x}_{\mathrm{Q}}\right) \in\right.$ $\left.V^{\prime}(\{i\} \cup Q)\right\}$ for each $P \in \Pi^{N}$, each $Q \subset N \backslash P$, and each $i \in P$.

Remark 3.1. To redefine the above statement for the commodity space, we need to impose more restrictions of invariance of utility levels on the translation in Remark 2.6. Thus the above version is even weaker than the previous one.

Definition. Let $\Gamma$ be a nonempty class of games. Then a solution $\sigma$ on $\Gamma$ satisfies bilateral consistency (BCS ) if

$$
\forall(\mathrm{N}, \mathrm{~V}) \in \Gamma, \forall \mathrm{x} \in \sigma(\mathrm{~N}, \mathrm{~V}), \forall \mathrm{P} \in \Pi^{\mathrm{N}},\left(\mathrm{P}, \mathrm{~V}_{\mathrm{xP}}\right) \in \Gamma \& \mathrm{x}_{\mathrm{P}} \in \sigma\left(\mathrm{P}, \mathrm{~V}_{\mathrm{xP}}\right)
$$

Definition. Let $\Gamma$ be a nonempty class of games. Then a solution $\sigma$ on $\Gamma$ satisfies converse consistency (CCS ) if

$$
\forall(\mathrm{N}, \mathrm{~V}) \in \Gamma, \forall \mathrm{x} \in \_\mathrm{V}(\mathrm{~N}),\left[\left(\forall \mathrm{P} \in \Pi^{\mathrm{N}}, \mathrm{x}_{\mathrm{P}} \in \sigma\left(\mathrm{P}, \mathrm{~V}_{\mathrm{xP}}\right)\right) \Rightarrow \mathrm{x} \in \sigma(\mathrm{~N}, \mathrm{~V})\right]
$$

Remark 3.2. On a rich class of smooth games, Prk satisfies BCS and CCS.

Remark 3.3. Let $\Gamma^{\{i, j\}}$ be the class of two-person smooth games (\{i, j\},V). Then a solution on $\Gamma\{\mathrm{i}, \mathrm{j}\}$ satisfies NEV, PE, ETP for TU games, SIV, LID, BCS, and CCS if and only if it is Prk.

## 4. A Characterization of the Prekernel

We have checked that on a class of smooth games, the solution Prk is nonemptyvalued, and satisfies PE, ETP for TU games, SIV, and LID. We next show that it is uniquely characterized by two-person versions of all the axioms together with bilateral consistency and its converse.

Theorem 1. Let $\Gamma_{0}$ be a rich class of smooth games. A solution on $\Gamma_{0}$ satisfies NEV for two-person games, PE for two-person games, ETP for two-person TU games, SIV for two-person games, and LID for two-person games, BCS and CCS if and only if it is Prk.

Proof. The solution Prk on $\Gamma_{0}$ satisfies NEV for two-person game, PE for twoperson game, ETP for two-person TU games, SIV, LID, BCS, and CCS. Now we prove the uniqueness. Let $(\mathrm{N}, \mathrm{V}) \in \Gamma_{0}$, and $\sigma$ a solution on $\Gamma_{0}$ that satisfies NEV ,

PE, ETP for TU games, SIV and LID for two-person games, and satisfies BCS and CCS on $\Gamma_{0}$. We prove that $\sigma(\mathrm{N}, \mathrm{V})=\operatorname{Prk}(\mathrm{N}, \mathrm{V})$. The proof for $|\mathrm{N}|=1$ is trivial. We have already proven the case of $|N|=2$. Then consider the case of $|N| \geq 3$.

Suppose that $\operatorname{Prk}(\mathrm{N}, \mathrm{V})$ _ $\emptyset$. Let $\mathrm{x} \in \operatorname{Prk}(\mathrm{N}, \mathrm{V})$. By the BCS of Prk, $\mathrm{x}_{\mathrm{P}} \in$ $\operatorname{Prk}\left(P, V_{x P}\right)$ for every $P \in \Pi^{N}$. Hence, $x_{P} \in \sigma\left(P, V_{x P}\right)$ for every $P \in \Pi^{N}$. By the CCS of $\sigma, \mathrm{x} \in \sigma(\mathrm{N}, \mathrm{V})$. Hence, $\operatorname{Prk}(\mathrm{N}, \mathrm{V}) \subset \sigma(\mathrm{N}, \mathrm{V})$. Note that $\sigma(\mathrm{N}, \mathrm{V}) \_\emptyset$. Then we can similarly show that $\sigma(\mathrm{N}, \mathrm{V}) \subset \operatorname{Prk}(\mathrm{N}, \mathrm{V})$. Thus, $\sigma(\mathrm{N}, \mathrm{V})=\operatorname{Prk}(\mathrm{N}, \mathrm{V})$.

Suppose that $\operatorname{Prk}(\mathrm{N}, \mathrm{V})=\emptyset$. Let $\mathrm{x} \in \__{-} \mathrm{V}(\mathrm{N})$. By the CCS of Prk, there exist at least one pair Q of players in N such that $\mathrm{x}_{\mathrm{Q}} \notin \operatorname{Prk}\left(\mathrm{Q}, \mathrm{V}_{\mathrm{xQ}}\right)$. Since $\left(\mathrm{Q}, \mathrm{V}_{\mathrm{xQ}}\right)$ is a two-person game, we have $\operatorname{Prk}\left(\mathrm{Q}, \mathrm{V}_{\mathrm{xQ}}\right)=\sigma\left(\mathrm{Q}, \mathrm{V}_{\mathrm{xQ}}\right)$, so that $\mathrm{x}_{\mathrm{Q}} \notin \sigma\left(\mathrm{Q}, \mathrm{V}_{\mathrm{xQ}}\right)$. By the BCS of $\sigma, \mathrm{x} \notin \sigma(\mathrm{N}, \mathrm{V})$. Hence, there is no payoff profile in $\sigma(\mathrm{N}, \mathrm{V})$, so that $\sigma(\mathrm{N}, \mathrm{V})$ $=\emptyset$. Thus, $\sigma(\mathrm{N}, \mathrm{V})=\operatorname{Prk}(\mathrm{N}, \mathrm{V})$.

In Theorem 1, we have used seven axioms. It does not look so elegant, and Lensberg (1988) actually proves that under consistency, we do not need any such conditions as the "independence of irrelevant alternatives" to axiomatize the Nash solution on the class of pure bargaining problems with valuable populations. The following examples show that we are not able to drop any of the seven axioms to characterize Prk on a class of smooth games even with valuable populations.

Example 4.1: For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{0}$, let $\sigma(\mathrm{N}, \mathrm{V})=\emptyset$. Then $\sigma$ vacuously satisfies all the conditions except NEV for two-person games.

Example 4.2: For every two-person game ( $\mathrm{P}, \mathrm{V}$ ), define

$$
\begin{array}{lll}
b(P, V)= & \left(v_{i}\right)_{i \in P} & \text { if }\left(v_{i}\right)_{i \in P} \in \operatorname{intV}(P) ; \\
& P r k(P, V) & \text { if }\left(v_{i}\right)_{i \in P} \notin \operatorname{intV}(P) .
\end{array}
$$

For every $(N, V) \in \Gamma_{0}$, let $\sigma(N, V)=\left\{x \in V(N) \mid x_{P} \in b\left(P, V_{x P}\right)\right.$ for all $\left.P \in \Pi^{N}\right\}$. Then $\sigma$ satisfies all the conditions except PE for two-person games.

Example 4.3: For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{0}$, let $\sigma(\mathrm{N}, \mathrm{V})=\__{\mathrm{V}}(\mathrm{N})$. Then $\sigma$ satisfies all the conditions except ETP for two-person TU games.

Example 4.4: For every $(N, V) \in \Gamma_{0}$, let $\sigma(N, V)=\left\{x \in \_V(N) \mid x_{i}-v_{i}\left(x_{-\{i, j}\right)=x_{j}{ }^{-}\right.$ $\mathrm{v}_{\mathrm{j}}\left(\mathrm{x}_{-\{\mathrm{i}, \mathrm{j}\}}\right)$ for each $\left.\mathrm{i}, \mathrm{j} \in \mathrm{N}\right\}$. Then $\sigma$ satisfies all the conditions except SIV for two-person games.

Example 4.5: For every two-person game ( $\mathrm{P}, \mathrm{V}$ ), define $\mathrm{a}(\mathrm{P}, \mathrm{V})=\left(\mathrm{a}_{\mathrm{i}}(\mathrm{P}, \mathrm{V})\right)_{\mathrm{i} \in \mathrm{P}}$ by $a_{i}(P, V)=\max \left\{x_{i} \in R\{i\} \mid\left(x_{i}, V_{-i}\right) \in V(P)\right\}$ for all $i \in P$. For every $(N, V) \in \Gamma_{0}$, let $\sigma(N, V)=\left\{x \in \partial V(N) \mid x_{P} \in\left[\left(v_{i}\left(x_{-P}\right)\right)_{i \in P}, a\left(P, V_{x P}\right)\right]\right.$ for each $\left.P \in \Pi^{N}\right\}$, where $[c, d]$
$=\left\{(1-t) c+t d 0^{2} t^{2} 1\right\}$ for each $c, d \in R^{P}$. That is, for every pair $P$ of players in $\mathrm{N}, \mathrm{x}_{\mathrm{P}}$ is the maximal point of the feasible set $\mathrm{V}_{\mathrm{xP}}$ on the segment connecting $\left(\mathrm{v}_{\mathrm{i}}\left(\mathrm{x}_{-}\right.\right.$ $\left.{ }_{P}\right)_{i \in P}$ to $a\left(P, V_{X P}\right)$ if $x \in \sigma(N, V)$. Note that $\sigma$ is a modification of the KalaiSmorodinsky bargaining solution, and $\sigma$ satisfies all the conditions except LID for two-person games.

Example 4.6: Let $(\mathrm{N}, \mathrm{V}) \in \Gamma_{0}$, and $\mathrm{i}, \mathrm{j} \in \mathrm{N}$. Then i and j are equivalent if $\mathrm{g}_{\mathrm{i}}(\mathrm{x})(\mathrm{x})\left(\mathrm{v}_{\mathrm{i}}\left(\{\mathrm{i}\} \cup S ; \mathrm{x}_{\mathrm{S}}\right)-\mathrm{v}_{\mathrm{i}}\right)=\mathrm{g}_{\mathrm{j}}(\mathrm{x})\left(\mathrm{v}_{\mathrm{j}}\left(\{\mathrm{j}\} \cup S ; \mathrm{x}_{\mathrm{S}}\right)-\mathrm{v}_{\mathrm{j}}\right)$ for every $\mathrm{x} \in \__{-} \mathrm{V}(\mathrm{N})$, and for each $S \subset N \backslash\{i, j\}$, where $v_{i}\left(\{i\} \cup S ; x_{S}\right)=\max \left\{y_{i} \in R^{\{i\}} \mid\left(y_{i}, x_{S}\right) \in V(\{i\} \cup S)\right\}$ for each $i \in N$, and each $S \subset N \backslash\{i\}$. Note that $g_{i}(x)\left(v_{i}\left(x_{-\{i, j\}}\right)-v_{i}\right)=g_{j}(x)\left(v_{j}\left(x_{-\{i, j}\right)\right)-$ $v_{j}$ ) for every $x \in \_V(N)$ if players $i$ and $j$ are equivalent. Now let $\sigma(N, V)=\{x \in$ ${ }_{-} V(N) \mid g_{i}(x)\left(x_{i}-v_{i}\right)=g_{j}(x)\left(x_{j}-v_{j}\right)$ if $i, j \in N$ are equivalent $\}$. We can verify that $\sigma$ satisfies the five axioms imposed on two-person games: NEV, PE, ETP for TU games, SIV, and LID. If $|\mathrm{N}|=2$, then the two players in N are equivalent, and $\sigma(\mathrm{N}, \mathrm{V})=$ $\operatorname{Prk}(\mathrm{N}, \mathrm{V})$. To prove that $\sigma$ satisfies CCS, suppose that $\mathrm{x} \in{ }_{-} \mathrm{V}(\mathrm{N})$ is such that $\mathrm{x}_{\mathrm{P}}$ $\in \sigma\left(P, V_{x P}\right)=\operatorname{Prk}\left(P, V_{x P}\right)$ for each $P \in \Pi^{N}$. Since Prk satisfies CCS, $x \in \operatorname{Prk}(N$, $\mathrm{V})$. We show that $\operatorname{Prk}(\mathrm{N}, \mathrm{V}) \subset \sigma(\mathrm{N}, \mathrm{V})$ if $|\mathrm{N}|^{3} 3$. Let $\mathrm{x} \in \operatorname{Prk}(\mathrm{N}, \mathrm{V})$. Then $\mathrm{x} \in$ ${ }_{-} V(N)$. Assume that $i, j \in N$ are equivalent. Since $x \in{ }_{-} V(N)$, we have $g_{i}(x)\left(v_{i}\left(x_{-}\right.\right.$ $\left.\left.\{i, j\})-v_{i}\right)=g_{j}(x)\left(v_{j}\left(x_{-\{i, j}\right)\right)-v_{j}\right)$, so that $g_{i}(x)\left(x_{i}-v_{i}\right)-g_{j}(x)\left(x_{j}-v_{j}\right)=g_{i}(x)\left(x_{i}-v_{i}\left(x_{-}\right.\right.$ $\{i, j\})-g_{j}(x)\left(x_{j}-v_{j}\left(x_{-\{i, j}\right\}\right)$. Since $x \in \operatorname{Prk}(N, V)$, we have $g_{i}(x)\left(x_{i}-v_{i}\left(x_{-\{i, j}\right)\right)=$ $g_{j}(x)\left(x_{j}-v_{j}\left(x_{-\{i, j}\right)\right)$, so that $g_{i}(x)\left(x_{i}-v_{i}\right)-g_{j}(x)\left(x_{j}-v_{j}\right)=0$. Hence, $x \in \sigma(N, V)$, i.e., $\operatorname{Prk}(\mathrm{N}, \mathrm{V}) \subset \sigma(\mathrm{N}, \mathrm{V})$. Thus, $\sigma$ satisfies CCS. Suppose that $\mathrm{N}=\{1,2,3\}$, and V is a TU game defined by $\mathrm{v}(\{1\})=\mathrm{v}(\{2\})=\mathrm{v}(\{3\})=0, \mathrm{v}(\{1,2\})=4, \mathrm{v}(\{1,3\})=3, \mathrm{v}(\{2$, $3\})=2$, and $\mathrm{v}(\{1,2,3\})=6$. Then $(\mathrm{N}, \mathrm{V})$ has no pair of equivalent players, so that $\sigma(\mathrm{N}, \mathrm{V})={ }_{-} \mathrm{V}(\mathrm{N})$. Let $\mathrm{x}=(2,2,2) \in \sigma(\mathrm{N}, \mathrm{V})$, then $\sigma\left(\{1,2\}, \mathrm{V}\left(\mathrm{x}_{-\{1,2\}}\right)\right)=\{(2.5$, 1.5) \}. Hence, $\sigma$ does not satisfy BCS.

Example 4.7: For every $(N, V) \in \Gamma_{0}$, let $\sigma(N, V)=\left\{x \in \operatorname{Prk}(N, V) \mid v_{i}\left(X_{-\{i, j\}}\right)=v_{i}\left(x_{-}\right.\right.$ $\{\mathrm{i}, \mathrm{k}\}$ ) for each $\mathrm{i}, \mathrm{j}, \mathrm{k} \in \mathrm{N}$ with $\left.\mathrm{j}_{-} \mathrm{i}_{-} \mathrm{k}\right\}$. Note that $\sigma(\mathrm{N}, \mathrm{V})=\operatorname{Prk}(\mathrm{N}, \mathrm{V})$ if $|\mathrm{N}|=2$. Then $\sigma$ satisfies all the conditions except CCS.

Remark 4. 1. The solution Prk satisfies PE, ETP for TU games, SIV, and LID over the class of $n$-person smooth games, $n^{3} 2$. It does not satisfy, however, NEV over the same class (see Serrano (1995, Example 2), and Moldovanu (1990, p.188)).

We next study the intersection of the core and the prekernel on the class of games with nonempty core.

Definition. Let ( $\mathrm{N}, \mathrm{V}$ ) be a game, $\mathrm{S} \subset \mathrm{N}$, and $\mathrm{x} \in \mathrm{R}^{\mathrm{N}}$. Then S can improve upon $\mathbf{x}$ if there is $\mathrm{y} \in \mathrm{V}(\mathrm{S})$ such that $y_{i}>x_{i}$ for all $i \in S$. The core of $(\mathbf{N}, \mathbf{V})$ is: $\mathrm{C}(\mathrm{N}, \mathrm{V})=\{\mathrm{x} \in \mathrm{V}(\mathrm{N}) \mid$ There is no coalition that can improve upon x$\}$.

Definition. Let ( $\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}$ ) be a two-person smooth game. The core-kernel of ( $\{\mathbf{i}, \mathbf{j}\}$, V) is:

$$
\mathrm{CK}(\{\mathrm{i}, \mathrm{j}\}, \mathrm{V})=\left\{\mathrm{x} \in \mathrm{C}(\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}) \mid \mathrm{g}_{\mathrm{i}}(\mathrm{x})\left(\mathrm{x}_{\mathrm{i}}-\mathrm{v}_{\mathrm{i}}\right)=\mathrm{g}_{\mathrm{j}}(\mathrm{x})\left(\mathrm{x}_{\mathrm{j}}-\mathrm{v}_{\mathrm{j}}\right)\right\},
$$

where $g$ is a representation for $V(\{i, j\})$, and $\left(v_{i}, v_{j}\right)=(\operatorname{maxV}(\{i\}), \max V(\{j\}))$.

Remark 4.2. The solution CK reduces to the Nash bargaining solution on the class of two-person smooth games ( $\{\mathrm{i}, \mathrm{j}\}, \mathrm{V}$ ) such that $\mathrm{V}(\{\mathrm{i}, \mathrm{j}\})$ is a convex set.

Proposition 2. Let $\Gamma_{\mathrm{C}}\{\mathrm{i}, \mathrm{j}\}$ be the class of two-person smooth games $(\{\mathrm{i}, \mathrm{j}\}, \mathrm{V})$ with nonempty core. Then a solution on $\Gamma_{\mathrm{C}}{ }^{\{\mathrm{i}, \mathrm{j}\}}$ satisfies NEV, PE, ETP for TU games, SIV, and LID if and only if it is CK.

Proof. The solution CK on $\Gamma_{\mathrm{C}}{ }^{\{\mathrm{i}, \mathrm{j}\}}$ satisfies NEV, PE, ETP for TU games, SIV, and LID. Now we prove the uniqueness. Say $i=1$, and $j=2$. Let $(\{1,2\}, V)$ be a twoperson smooth game, and $\sigma$ a solution on $\Gamma_{\mathrm{C}}\{\mathrm{i}, \mathrm{j}\}$ which satisfies NEV, PE, ETP for TU games, SIV, and LID. We prove that $\sigma(\{1,2\}, \mathrm{V})=\operatorname{CK}(\{1,2\}, \mathrm{V})$.

By NEV, there exists $x=\left(x_{1}, x_{2}\right) \in C K(\{1,2\}, V)$. By PE, $x \in{ }_{\_} V(\{1,2\})$. By differentiability, there is a unique tangent line of the curve ${ }_{-} V(\{1,2\})$ at $x$ : $\nabla \mathrm{g}(\mathrm{x}) \cdot(\mathrm{z}-\mathrm{x})=\mathrm{g}_{1}(\mathrm{x})\left(\mathrm{z}_{1}-\mathrm{x}_{1}\right)+\mathrm{g}_{2}(\mathrm{x})\left(\mathrm{z}_{2}-\mathrm{x}_{2}\right)=0$. Define the two-person smooth game $\left(\{1,2\}, V^{\prime}\right)$ by $V^{\prime}(\{1\})=V(\{1\}), V^{\prime}(\{2\})=V(\{2\})$, and $V^{\prime}(\{1,2\})=\left\{z \in R^{\{1,2\}} \mid\right.$ $\left.\nabla \mathrm{g}(\mathrm{x}) \cdot(\mathrm{z}-\mathrm{x})^{2} 0\right\}$. Then, by the LID of $\mathrm{CK}, \mathrm{x} \in \mathrm{CK}\left(\{1,2\}, \mathrm{V}^{\prime}\right)$. Note that
$C K\left(\{1,2\}, V^{\prime}\right)=\left\{\left(\left[\left(g_{2}(x) / g_{1}(x)\left(x_{2}-v_{2}{ }^{\prime}\right)+x_{1}+v_{1} '^{\prime} / 2,\left[\left(g_{1}(x) / g_{2}(x)\left(x_{1}-v_{1}\right)^{\prime}\right)+x_{2}+v_{2}{ }^{\prime}\right] / 2\right)\right\}\right.\right.$, which is the midpoint of the segment on the line ${ }^{2} \mathrm{~V}^{\prime}(\{1,2\})$ truncated by $\left(\mathrm{v}_{1}{ }^{\prime}, \mathrm{v}_{2}{ }^{\prime}\right)=$ $\left(\max V^{\prime}(\{1\}), \max \mathrm{V}^{\prime}(\{2\})\right)$. Hence, $\{\mathrm{x}\}=\mathrm{CK}\left(\{1,2\}, \mathrm{V}^{\prime}\right)$ (see Figure 2). ${ }^{3}$ Define the TU game (\{1, 2\}, w) by $w(\{1\})=0=w(\{2\})$, and $w(\{1,2\})=g_{1}(x)\left(x_{1}-v_{1}{ }^{\prime}\right)+$ $g_{2}(x)\left(x_{2}-v_{2}\right)$. By NEV, PE and ETP for TU games, $\sigma(\{1,2\}, w)=\{(1 / 2) w(\{1,2\})$, $(1 / 2) w(\{1,2\})\}$. Let $\alpha=\left(1 / g_{1}(x), 1 / g_{2}(x)\right)$, and $\left.\beta=\left(v_{1}{ }^{\prime}, v_{2}\right)^{\prime}\right)$. By SIV,

$$
\begin{aligned}
& \sigma(\{1,2\}, \lambda \alpha \beta(\mathrm{w}))=\lambda_{\mathrm{N}} \alpha \beta(\sigma(\{1,2\}, \mathrm{w})) \\
& \left.=\left\{\left(\left(1 / 2 \mathrm{~g}_{1}(\mathrm{x})\right) \mathrm{w}(\{1,2\})+\mathrm{v}_{1^{\prime}},\left(1 / 2 \mathrm{~g}_{2}(\mathrm{x})\right) \mathrm{w}(\{1,2\})+\mathrm{v}_{2}{ }^{\prime}\right)\right)\right\} \\
& =\mathrm{CK}\left(\{1,2\}, \mathrm{V}^{\prime}\right)=\{\mathrm{x}\} .
\end{aligned}
$$

Note that $\left(\{1,2\}, \lambda^{\alpha \beta}(w)\right)$ is the game $\left(\{1,2\}, V^{\prime}\right)$. Hence, $\sigma\left(\{1,2\}, V^{\prime}\right)=\sigma(\{1,2\}$, $\left.\lambda^{\alpha \beta}(w)\right)=\{x\}$, so that $x \in \sigma\left(\{1,2\}, V^{\prime}\right)$. By LID, $x \in \sigma(\{1,2\}, V)$. Thus, CK $(\{1,2\}$,

[^3]$\mathrm{V}) \subset \sigma(\{1,2\}$, V). In exactly the same way, we can show $\sigma(\{1,2\}, \mathrm{V}) \subset \mathrm{CK}(\{1,2\}$, V). Hence, $\sigma(\{1,2\}, V)=\operatorname{CK}(\{1,2\}, V)$.

Definition. Let ( $\mathrm{N}, \mathrm{V}$ ) be a game. The core-kernel of $(\mathbf{N}, \mathbf{V})$ is:
$C K(N, V)=\left\{x \in C(N, V) \mid g_{i}(x)\left(X_{i}-V_{i}\left(X_{-\{i, j}\right)\right)=g_{j}(x)\left(x_{j}-V_{j}\left(x_{-\{i}, j\right\}\right)\right)$ for each $\left.\mathrm{i}, \mathrm{j} \in \mathrm{N}\right\}$, where $g$ is a representation for $V(N)$, and $\left(v_{i}\left(X_{-\{i, j}\right), \mathrm{v}_{\mathrm{j}}\left(\mathrm{x}_{-\{\mathrm{i}, \mathrm{j}\}}\right)\right)=\left(\max _{\mathrm{x}\{\mathrm{i}, \mathrm{j}\}}(\{\mathrm{i}\})\right.$, $\left.\max V_{x\{i, j\}}(\{j\})\right)$.

Theorem 2. Let $\Gamma_{\mathrm{C}}$ be a rich class of smooth games with nonempty core. A solution on $\Gamma_{\mathrm{C}}$ satisfies NEV for two-person games, PE for two-person games, ETP for twoperson TU games, SIV two-person games, and LID for two-person games, BCS and CCS if and only if it is CK .

Proof. The solution CK on $\Gamma_{\mathrm{C}}$ satisfies NEV for two-person game, PE for twoperson game, ETP for two-person TU games, SIV, LID, BCS, and CCS. Now we prove the uniqueness. Let $(\mathrm{N}, \mathrm{V}) \in \Gamma_{\mathrm{C}}$, and $\sigma$ a solution on $\Gamma_{\mathrm{C}}$ that satisfies NEV , PE, ETP for TU games, SIV and LID for two-person games, and satisfies BCS and CCS on $\Gamma_{\mathrm{C}}$. We prove that $\sigma(\mathrm{N}, \mathrm{V})=\mathrm{CK}(\mathrm{N}, \mathrm{V})$. The proof for $|\mathrm{N}|=1$ is trivial. We have already proven the case of $|N|=2$. Then consider the case of $|N| \geq 3$.

Suppose that $\mathrm{CK}(\mathrm{N}, \mathrm{V}) \__{-}$Ø. Let $\mathrm{x} \in \mathrm{CK}(\mathrm{N}, \mathrm{V})$. By the BCS of CK, $\mathrm{x}_{\mathrm{p}} \in$ $C K\left(P, V\left(x_{-p}\right)\right)$ for every $P \in \Pi^{N}$. Hence, $x_{p} \in \sigma\left(P, V\left(x_{-p}\right)\right)$ for every $P \in \Pi^{N}$. By the CCS of $\sigma, \mathrm{x} \in \sigma(\mathrm{N}, \mathrm{V})$. Hence, $\mathrm{CK}(\mathrm{N}, \mathrm{V}) \subset \sigma(\mathrm{N}, \mathrm{V})$. Note that $\sigma(\mathrm{N}, \mathrm{V}){ }_{\mathrm{L}}$. . Then we can similarly show that $\sigma(\mathrm{N}, \mathrm{V}) \subset \mathrm{CK}(\mathrm{N}, \mathrm{V})$. Thus, $\sigma(\mathrm{N}, \mathrm{V})=\mathrm{CK}(\mathrm{N}, \mathrm{V})$.

Suppose that $\mathrm{CK}(\mathrm{N}, \mathrm{V})=\emptyset$. Let $\mathrm{x} \in \_\mathrm{V}(\mathrm{N})$. Then by the CCS of CK , there exist at least one pair Q of players in N such that $\mathrm{x}_{\mathrm{Q}} \notin \mathrm{CK}\left(\mathrm{Q}, \mathrm{V}\left(\mathrm{x}_{-\mathrm{Q}}\right)\right)$. Since ( Q , $\left.\mathrm{V}\left(\mathrm{x}_{-\mathrm{Q}}\right)\right)$ is a two-person game, we have $\mathrm{CK}\left(\mathrm{Q}, \mathrm{V}\left(\mathrm{x}_{-\mathrm{Q}}\right)\right)=\sigma\left(\mathrm{Q}, \mathrm{V}\left(\mathrm{x}_{-\mathrm{Q}}\right)\right)$, so that $\mathrm{x}_{\mathrm{Q}} \notin$ $\sigma\left(\mathrm{Q}, \mathrm{V}\left(\mathrm{x}_{-\mathrm{Q}}\right)\right)$. By the BCS of $\sigma, \mathrm{x} \notin \sigma(\mathrm{N}, \mathrm{V})$. Hence, there is no payoff profile in $\sigma(\mathrm{N}, \mathrm{V})$, so that $\sigma(\mathrm{N}, \mathrm{V})=\emptyset$. Thus, $\sigma(\mathrm{N}, \mathrm{V})=\mathrm{CK}(\mathrm{N}, \mathrm{V})$..

Moldovanu (1990, Theorem 5.2) considers the same solution on the class of NTU assignment games. For characterization, he implicitly assumes that the solution under investigation is single-valued for two-person games of the domain. He thus uses the "independence of irrelevant alternatives" as one of the axioms instead of local independence. If we do not assume either such a single-valuedness condition or local independence, we are not able to show more than that the solution contains the intersection of the core and the prekernel, that is, $\sigma(\mathrm{N}, \mathrm{V}) \subset \mathrm{CK}(\mathrm{N}, \mathrm{V})$ for every game $(\mathrm{N}, \mathrm{V})$ of the domain.

The following examples show the independence of the axioms in Theorem 2.

Example 4.1': For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{\mathrm{C}}$, let $\sigma(\mathrm{N}, \mathrm{V})=\emptyset$. Then $\sigma$ vacuously satisfies all the conditions except NEV for two-person games in $\Gamma_{\mathrm{C}}$.

Example 4.2': For every two-person game $(P, V)$, define $d(P, V)=\left(v_{i}\right)_{i \in p}$. For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{\mathrm{C}}$, let $\sigma(\mathrm{N}, \mathrm{V})=\left\{\mathrm{x} \in \mathrm{V}(\mathrm{N}) \mid \mathrm{x}_{\mathrm{P}} \in \mathrm{d}\left(\mathrm{P}, \mathrm{V}_{\mathrm{xP}}\right)\right.$ for all $\left.\mathrm{P} \in \Pi^{\mathrm{N}}\right\}$. Then $\sigma$ satisfies all the conditions except PE for two-person games in $\Gamma_{\mathrm{C}}$.

Example 4.3': For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{\mathrm{C}}$, let $\sigma(\mathrm{N}, \mathrm{V})=\mathrm{C}(\mathrm{N}, \mathrm{V})$. Then $\sigma$ satisfies all the conditions except ETP for two-person TU games in $\Gamma_{\mathrm{C}}$.

Example 4.4': For every $(N, V) \in \Gamma_{C}$, let $\sigma(N, V)=\left\{x \in{ }_{-} V(N) \mid x_{i}-v_{i}\left(x_{-\{i, j\}}\right)=x_{j}\right.$ $-\mathrm{v}_{\mathrm{j}}\left(\mathrm{X}_{-}\{\mathrm{i}, \mathrm{j}\}\right)$ for each $\left.\mathrm{i}, \mathrm{j} \in \mathrm{N}\right\}$. Then $\sigma$ satisfies all the conditions except SIV for twoperson games in $\Gamma_{\mathrm{C}}$.

Example 4.5': For every two-person game ( $\mathrm{P}, \mathrm{V}$ ), define $a(P, V) \equiv\left(a_{i}(P, V)\right)_{i \in p}$ by $a_{i}(P, V)=\max \left\{x_{i} \in R^{\{i\}} \mid\left(x_{i}, v_{-i}\right) \in V(P)\right\}$ for all $i \in P$. For every $(N, V) \in \Gamma_{C}$, let $\sigma(N, V)=\left\{x \in \_V(N) \mid x_{P} \in\left[\left(v_{i}\left(x_{-p}\right)\right)_{i \in p}, a\left(P, V_{x P}\right)\right]\right.$ for each $\left.P \in \Pi^{N}\right\}$. Then $\sigma$ satisfies all the conditions except LID for two-person games in $\Gamma_{\mathrm{C}}$.

Example 4.6': For every $(\mathrm{N}, \mathrm{V}) \in \Gamma_{\mathrm{C}}$, let $\sigma(\mathrm{N}, \mathrm{V})=\operatorname{Prk}(\mathrm{N}, \mathrm{V})$. Then $\sigma$ satisfies all the conditions except ETP for two-person TU games in $\Gamma_{\mathrm{C}}$.

Example 4.7': For every $(N, V) \in \Gamma_{C}$, let $\sigma(N, V)=\left\{x \in C K(N, V) \mid v_{i}\left(x_{-\{i, j\}}\right)=\right.$ $\mathrm{v}_{\mathrm{i}}\left(\mathrm{X}_{-}\{\mathrm{i}, \mathrm{k}\}\right)$ for each $\mathrm{i}, \mathrm{j}, \mathrm{k} \in \mathrm{N}$ with $\left.\mathrm{j}_{-} \mathrm{i}_{-} \mathrm{k}\right\}$. Note that $\sigma(\mathrm{N}, \mathrm{V})=\mathrm{CK}(\mathrm{N}, \mathrm{V})$ if $|\mathrm{N}|$ $=2$. Then $\sigma$ satisfies all the conditions except CCS.

Remark 4. 3. The solution CK satisfies PE, ETP for TU games, SIV, and LID over the class of n-person smooth games with nonempty core, $\mathrm{n}^{3} 2$. It does not satisfy, however, NEV over the same class (see Moldovanu (1990, p.188)).

[^0]:    * Serrano acknowledges the hospitality of Universitat Pompeu Fabra, Barcelona, and the financial support of a 1995/1996 sabbatical grant from Spain's Ministry of Education and Science. Shimomura is grateful for suggestions by Haruo Imai and the participants in a seminar at Kyoto Institute of Economic Research, the hospitality of the Economics Department at Brown University, and funding from the Kyoto University Foundation in his sabbatical of 1994/1995 and Grants in Aid for Researrch 07730008 of the Ministry of Education in Japan.

[^1]:    1 In this sense, our work resembles Aumann's (1985) and Hart's axiomatizations of the Shapley NTU value and the Harsanyi value, respectively. These theorems combine the axioms of Nash (1950) and those of Shapley (1953).

[^2]:    2 We do not necessarilly assume that $\left(v_{i}, v_{j}\right) \in V(\{i, j\})$ for all $(\{i, j\}, V) \in \Gamma^{\{i, j\}}$.

[^3]:    ${ }^{3}$ For every $(\{i, j\}, V) \in \Gamma_{C}\{i, j\}, C(\{i, j\}, V) \_\emptyset$, i.e., $\left(v_{i}, v_{j}\right) \in V(\{i, j\})$.
