Africa Region Population Projections 1988-89 Edition

**My T. Vu,
Eduard Bos,
and
Rodolfo A. Bulatao**

**Its population — at the projected fertility and mortality rates —
will double in 20 years.**

The Policy, Planning, and Research Complex distributes PPR Working Papers to disseminate the findings of work in progress and to encourage the exchange of ideas among Bank staff and all others interested in development issues. These papers carry the names of the authors, reflect only their views, and should be used and cited accordingly. The findings, interpretations, and conclusions are the authors' own. They should not be attributed to the World Bank, its Board of Directors, its management, or any of its member countries.

Policy, Planning, and Research

WORKING PAPERS

Population, Health, and Nutrition

World population grew by around 88 million in 1987. The number added each year will continue to rise for another decade.

Africa now makes up only 9 percent of the world's population, but it will eventually contribute more to world population growth than any other region. Africa's contribution to world population growth is expected to rise from 17 percent today to 30 percent by 2025 and 45 per-

cent around 2050. Africa's population growth rates are very high and, with projected trends, will double the population in 20 years.

Africa includes the three countries with the highest fertility rates in the world — Rwanda, Kenya, and Malawi. It also includes five of the six countries with the lowest life expectancies. Both fertility and mortality are projected to decline in all countries, but will decline more slowly than in other regions.

This paper is a product of the Population, Health, and Nutrition Division, Population and Human Resources Department. Copies are available free from the World Bank, 1818 H Street NW, Washington DC 20433. Please contact Sonia Ainsworth, room S6-065, extension 31091.

The PPR Working Paper Series disseminates the findings of work under way in the Bank's Policy, Planning, and Research Complex. An objective of the series is to get these findings out quickly, even if presentations are less than fully polished. The findings, interpretations, and conclusions in these papers do not necessarily represent official policy of the Bank.

P R E F A C E

Population projections for all countries are prepared by the Population and Human Resources Department of the World Bank every year. They are published first in summary form in the Bank's World Development Report and later in greater detail as technical notes or working papers and, in alternate years, as a separate book.

This set of projections was prepared for World Development Report 1988. It appears for the first time in the Policy, Planning, and Research (PPR) Working Papers series. (Last year's edition appeared as a set of Population, Health, and Nutrition (PHN) Technical Notes.) No other publication is planned this year.

As was done last year, separate working papers cover each of the Bank's four regions: Africa (sub-Saharan); Asia (and Oceania); Europe, the Middle East, and North Africa (including the U.S.S.R.); and Latin America and the Caribbean (and Northern America). Combined, these papers cover all countries of the world.

The data format of these papers generally follows previous editions. Only minor changes have been made in the specific demographic indicators included.

We intend these papers to provide a convenient and up-to-date reference on the likely demographic future of each country, to facilitate the Bank's work of assisting them in planning more productive futures. We welcome comments on their utility, and how this might be enhanced.

Anthony R. Measham
Chief
Population, Health and Nutrition Division

A C K N O W L E D G E M E N T S

A number of persons provided us with important information for this work or assisted us in preparing it in other ways. The Estimates and Projections Section of the U.N. Population Division has been continually supportive in providing us with data, often prior to its publication in their own books. We are grateful to the section chief, Y. C. Yu, and to his continually accommodating staff, as well as to the head of the division, Jean-Claude Chasteland. Through the U.N. Population Division, we also received data from the Centro Latinoamericano de Demografia (Celade).

World Bank country economists and population specialists in the operating divisions have also provided us with recent population estimates, bringing to our attention government reports we might not otherwise see. Among them, we wish to particularly acknowledge Althea Hill, who has in addition provided us with important analyses of her own.

This exercise was carried out using a personal computer program, PROJPC, written by Kenneth Hill of Johns Hopkins University. For this year's work, Hill undertook various revisions and refinements of the program that have speeded up the process.

As was its predecessor, the post-reorganization Population, Health and Nutrition Division has been hospitable to this work. Dean T. Jamison, the division chief during most of the period of this exercise, showed more interest in and enthusiasm for these figures than any of us would have predicted. His successor, Dr. Anthony R. Measham, has continued in the same supportive mode.

We also wish to acknowledge the interest of the Bank's International Economics Socioeconomic Data Division (IECSE), which not only consumes our numbers and incorporates them into the databases it maintains and publications it distributes but also helps coordinate communications with country economists.

Useful comments on the introduction were provided by Dr. Fred Sai and Susan H. Cochrane. In producing the manuscript, Ella Hornsby was responsible not only for typing and some data entry but also for coordinating the paper flow.

I N T R O D U C T I O N

Population projections are reported here for the individual countries comprising one of the four World Bank regions. Companion papers in this series report projections for each of the other regions. Each paper also reports summary results for various geographic regions and income groups.

This introduction (included, for convenience, in each paper of the series) explains what projection results are provided in the detailed tables; describes the projection methodology; and summarizes and interprets the main results.

Caution is appropriate with most projections like these. They essentially involve working out the implications of assumptions (to be discussed shortly) about particular demographic parameter levels and trends. None of the descriptions of results below should be read as indicating certitude about the future. Instead, they should be read with a universal qualifier in mind, that population will follow the indicated path if the assumptions prove to be correct.

Projection Results

The projections cover the period 1985-2150. Separate projections were prepared for 186 countries, economies, territories, or small-country groupings, covering the entire world. The length of the projection period is chosen to allow countries to approach stability, which for several is projected to take as long as two centuries.

Only one projection is reported per country, economy, territory, or group. Other projection exercises sometimes provide high and low options. Instead of providing multiple alternatives, we choose to give only our best estimate of the likely demographic future but to update this annually.

The detailed projection tables following this introduction contain two pages for each country. The first page gives projection results for every five years between 1985 and 2030, with population figures for years ending in 5 or 0 and demographic indicators for the intervening quinquennia. This information is provided:

- o Population by sex and five-year age groups
- o Birth rate, death rate, and net migration rate
- o Rate of natural increase and population growth rate
- o Total fertility rate (TFR) and net reproduction rate (NRR)
- o Expectation of life at birth ($e[0]$) and at age ten ($e[10]$)
- o Probability of dying before age one ($\times 1000$), labeled here the infant mortality rate (IMR)
- o Probability of dying before age five ($q[5]$)
- o The dependency ratio (for exact years rather than quinquennia)

The second page adds results for every 25 years from 2000 to 2150 (as well as rates for the 1985-2000 period). This page provides fewer indicators, including only the population by age and sex, the birth, death, net migration, and growth rates, total fertility, life expectancy, and infant mortality.

Most of these numbers are standard demographic indicators, but the infant mortality rate requires some qualification. More properly labeled IMR, it is an index extracted from a Coale-Demeny model life table chosen to provide an appropriate life expectancy. It need not, and often will not, correspond to an observed infant mortality rate.

Methods and Data Sources

The key elements in these projections are base-year (mid-1985) total population estimates and age-sex structures, base-period (1985-90) mortality, fertility, and migration rates, and assumed trends in the rates. These elements and additional assumptions that are made will all be described.

The basic methodology is identical to that used last year (see Zachariah and Vu 1988). Those familiar with the previous publication may therefore wish to skip to the summary of results. Data and sources have been updated; an Appendix indicates the sources for all base-year or base-period estimates.

Total population and age-sex composition

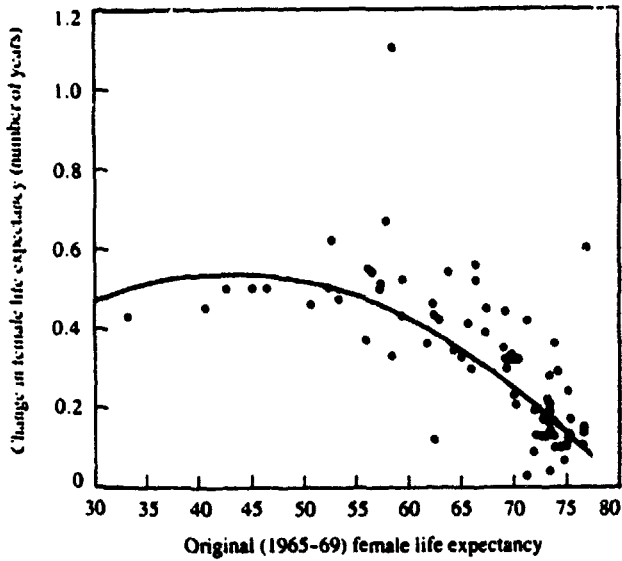

The estimates of total population in mid-1985 come from diverse sources. Where possible, estimates are Bank projections from reasonably complete censuses or official figures from governments with comprehensive population registration. Other official figures are also used, either from the U.N. Population and Vital Statistics Report or from government publications. When these figures do not pertain to 1985, they are projected forward. Other sources of estimates include the U.N. 1988 revision of world population prospects (forthcoming), the U.N. 1984 assessment (published in 1986), Eurostat (1987), the U.S. Bureau of the Census (1985), and Celade (1987). The specific source for each country is listed in the Appendix.

The 1985 population of each country was distributed by age and sex using a percentage distribution from either the latest census, adjusted for errors in age reporting, or the U.N. 1984 assessment (the 1988 revision was not yet available for this purpose).

Mortality level and trend

The base-period mortality levels in the projections are represented by life expectancies obtained, sometimes indirectly, from a variety of sources. Most commonly, figures are based on official or other estimates appearing in Population and Vital Statistics Report or government publications. Other figures are taken from the U.N. 1988 revision or the

Figure 3. Expected Change in Female Life Expectancy Based on Initial Female Life Expectancy and Level of Initial Female Primary School Enrollment

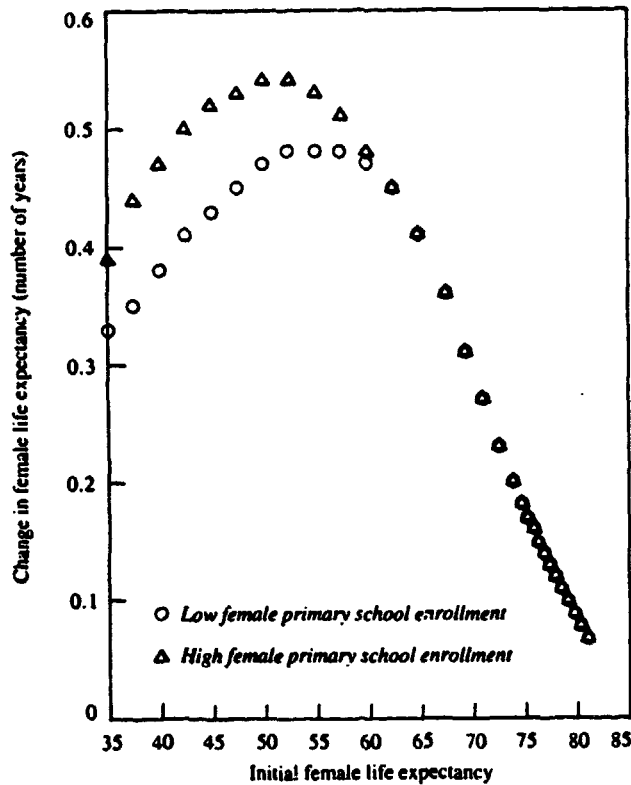

Figure 4. Age-Specific Fertility Patterns by Fertility Level

U.N. 1984 assessment. Other sources of mortality data include Eurostat (1987), the U.S. Bureau of the Census (1985), Celade (1987), and various surveys. These sources often report mortality levels for periods other than 1985-90, or give indices other than life expectancies, or both. Some estimation and projection is then necessary to obtain the right index. In some cases, a mortality estimate is made first for an earlier period, and an estimate for 1985-90 obtained by applying the projection methodology being described here. Some Bank sources are also cited in the Appendix: Bank sector reports; Bank assessments, involving unpublished analysis of census or survey data; and Bank estimates, or informed judgments for which no further source can be cited (see Appendix).

The future trend in mortality in all countries was represented by steady increments to life expectancy, with smaller increases at higher life expectancy levels, and with different schedules of increments where few or where many females are in school.

The schedules of increments for female life expectancy were developed in earlier analysis involving regressions of change in female life expectancy between 1965-69 and 1975-79 on initial life expectancies in 1965-69, separately for countries with different levels of female enrolment. Life expectancies were obtained from Bank files and female primary school enrolment in 1965-69 from Unesco (1977). Female enrolment was used as a control because preliminary analysis confirmed a strong relationship ($R^2 = 0.50$ over 30 developing countries) of female enrolment with current life expectancy and a slightly stronger relationship ($R^2 = 0.53$) with life expectancy lagged ten years. Countries were divided into two female enrolment groups: those with female primary school enrolment of 70 percent or more and those with female primary school enrolment of less than 70 percent.

Figures 1 and 2 plot changes in female life expectancy against initial levels for the two groups of countries. Also plotted are lines estimated through quadratic regression. The line for the low female enrolment group is almost linear. Female life expectancy was below 55 in all countries in this group (with the exception of Saudi Arabia, which was considered an anomaly and is not represented). We assumed that the increments to life expectancy in this group would increasingly approximate the increments in the high female enrolment group once life expectancy passed 55. This produced a single unified schedule of increments diagrammed in Figure 3 and listed in Table 1.

Male life expectancies were projected either by applying roughly the same schedule of increments as female life expectancies or by first selecting female life tables and then adopting for males the parallel life tables of the same level and family. In either case, the maximum life-table level for males was set at one below the equivalent female level, imposing a slower improvement in male life expectancies.

Life tables were chosen from among the Coale-Demeny models to provide the age distribution of deaths. These model life tables come in four families--North, South, East, and West--each of which has 25 levels. A

**Table 1. Annual Increment in Female
Life Expectancy**

Female life expectancy at birth	Female primary school enrollment	
	Less than 70 percent	70 percent or more
35.0	0.33	0.39
37.5	0.35	0.44
40.0	0.38	0.47
42.5	0.41	0.50
45.0	0.43	0.52
47.5	0.45	0.53
50.0	0.47	0.54
52.5	0.47	0.54
55.0	0.48	0.53
57.5	0.48	0.51
60.0	0.47	0.48
62.5	0.45	0.45
65.0	0.41	0.41
67.5	0.36	0.36
69.4	0.31	0.31
71.1	0.27	0.27
72.6	0.23	0.23
73.9	0.20	0.20
75.0	0.16	0.16
75.9	0.13	0.13
76.6	0.11	0.11
77.5	0.09	0.09
78.5	0.07	0.07
79.5	0.06	0.06
80.5	0.05	0.05
81.5	0.04	0.04
82.5	0.03	0.03

26th level corresponding to a female life expectancy of 82.5 was added. The appropriate level for each time period was chosen given life expectancy, with interpolation if necessary between adjacent levels. Choice among life table families was based on region and mortality level, as follows:

Region and mortality level	Life table family
Sub-Saharan Africa	
Below 12	South
12-17	North
18 and above	West
North Africa, the Middle East, Latin America, and the Caribbean	
Below 18	South
18 and above	West
Northern America, Europe, Asia, and Oceania	
All levels	West

Over time, countries in particular regions may therefore switch from one life table family to another. To avoid discontinuities, the switch is made gradually, using life tables linearly interpolated between the two families involved for five intervening periods.

Fertility level and trend

Base-period total fertility rates (TFRs) are derived from the same mix of sources as mortality rates, including the U.N. 1988 revision; official sources, as cited in Population and Vital Statistics Reports or in government publications; the U.N. 1984 assessment; the U.S. Bureau of the Census (1985); Eurostat (1987); and Celade (1987). We relied on two sources more frequently for information on fertility than mortality: various surveys, especially Demographic and Health Surveys and World Fertility Surveys; and the Institut National d'Études Démographiques (Monnier 1987). Often, all these sources give fertility for a different period or in terms of the crude birth rate, and corresponding TFRs had to be estimated using available data on age-sex composition and age-specific fertility, or obtained from a projection using an estimated TFR for an earlier period. Where no reliable source was available, an unattributed Bank estimate may be indicated in the Appendix.

Future fertility trends are specified by selecting a year when the net reproduction rate (NRR) reaches unity, i.e., when the average woman's fertility results in exactly replacing herself. (This is referred to here as the replacement year.) We explain below how the replacement year was selected, what was done for countries with NRR already below replacement; how the path of fertility between the present and the replacement year was specified; and what patterns of fertility by age were applied.

For all countries, the replacement year is assumed to be before

2050. Selecting the specific year was essentially a matter of collective judgment, aided by a particular regression procedure.

The regression involved predicting judgments of the replacement year from last year's exercise. These predictors were included in a stepwise regression: 1980-85 female life expectancy; 1980-85 TFR; change in the crude birth rate from 1970 to 1980; family planning status; and a dummy variable for region, distinguishing East and Southeast Asia from other regions. Family planning status was coded as 3 for a strong family planning program (or contraceptive prevalence rate for the latest available date of 31 percent or higher); 2 for a moderate program (or contraceptive prevalence of 16-30 percent); or 1 for a weak program (or contraceptive prevalence of 15 percent or lower). All variables contributed significantly, except change in the crude birth rate, which was dropped from the equation.

This equation and a similar but not identical equation estimated for previous exercises (Zachariah and Vu 1988) were used to predict the replacement year. Results were very close between the two equations. The predictions were examined and changed where warranted, in our judgment, and after comparison with U.N. Population Division projected fertility trends (from the forthcoming 1988 revision).

For countries with fertility already below replacement level, the alternative assumptions applied were that fertility would remain at its current level up to 2000, and then gradually rise to replacement level by 2030.

For the replacement year, TFR is simply determined from the country's mortality level, and TFR for periods beyond that was kept at replacement. TFR for earlier periods was determined through a more complicated procedure. The entire period between 1985-90 and the replacement year was divided conceptually into three phases: an early, an intermediate, and a late phase. All countries were assumed to pass through the late phase, but some were assumed to skip the early phase, the intermediate phase, or both.

In the early phase, covering 1985-95, TFR remains constant or actually rises. Such a phase was defined for some sub-Saharan countries, particularly in the zone of high sterility in Central Africa. All other countries skip this phase.

In the intermediate phase, TFR declines at an accelerating pace, following a reverse geometric curve. This phase lasts up to 1995 or 2000 for many countries in Asia, Latin America, and North Africa. For all sub-Saharan African countries (whether or not they have an early phase), the intermediate phase lasts until halfway between 1995 and the replacement year.

In the late phase, the TFR decline decelerates, following a geometric curve, or TFR may actually rise (if fertility is below replacement), also following a geometric curve. This phase covers the

entire period to the replacement year not covered by the other phases. All countries with initial TFR under 3.0 exhibit only this phase. All other countries also go through this phase, though it may begin later.

The age pattern of fertility was allowed to change with its level. The age patterns when TFR is 7.6, 4.1, or 2.8 are shown in Figure 4. The mean age at childbirth declines from 28.86 years when TFR = 7.6, to 28.45 years when TFR = 4.1, to 27.98 years when TFR = 2.8. For intermediate TFRs, the age pattern falls between these curves.

Migration level and trend

Estimates of international migration come from the U.N. 1984 assessment and the U.N. 1988 revision, documents prepared by the U.N. for the 1984 International Conference on Population, the U.S. Bureau of the Census (1985), Eurostat (1987), and Bank sources. To deal with the volatility of refugee movements in various parts of the developing world, only those are counted as migrants who are believed likely to remain permanently in the receiving countries.

Available data seldom include age-sex distributions of migrants, which were instead chosen in this manner. For each country, some estimate was made of the sex ratio among migrants. Based on this sex ratio, an appropriate age-sex distribution was chosen from among alternative models. This distribution was assumed to be constant over time, regardless of the total number of migrants.

Trends in the volume of migration are based on past trends, but are still essentially speculative. For most countries, net migration is assumed to decline to zero by the year 2000; for the remainder, net migration declines to zero by the year 2025.

Summary of Results

Summary projection results are provided in Tables 2-12. (Tables 4-12 appear at the end of this Introduction.) In discussing these tables, we will summarize world population growth; note changes in these projections from previous versions; compare the four World Bank regions and 19 country departments; note other comparisons among geographic regions and groups of countries by income level; observe the results for some individual countries; and essay a brief conclusion.

World population

The projections show world population rising from 4.843 billion in 1985 to 6.205 billion in 2000 and 8.262 billion in 2025 (Table 2). From 1985 to 2025, the birth rate per thousand population will decline by 10 points, but the death rate will decline by less than 2 points. As a consequence, the annual growth rate will fall from 1.7 percent to less than 1 percent.

Table 2. Population Growth by Geographic Region, 1985-2025

Region	Population (millions)		Growth rate (percent)		Birth rate (per 1,000)		Death rate (per 1,000)	
	1985	2025	1985-90	2020-25	1985-90	2020-25	1985-90	2020-25
World	4,843	8,262	1.73	0.96	27.1	17.8	9.8	8.2
Africa	560	1,508	3.06	1.76	44.8	24.3	14.2	6.6
America	667	1,040	1.55	0.72	23.2	15.3	7.9	8.1
Asia	2,821	4,815	1.84	0.91	27.7	17.2	9.2	8.0
Europe, U.S.S.R.	771	864	0.48	0.14	15.0	12.9	10.3	11.5
Oceania	25	35	1.41	0.56	19.9	14.7	8.1	9.1

Note: In all tables, figures may not add up to given totals because of rounding.

More people are now being added to the planet every year than ever before, even though the peak population growth rate (2.1 percent in 1965-70) is past. In 1987, about 88 million people were added, and this number will increase for another decade, eventually reaching about 92 million.

In the next century, the projections indicate that world population will continue to grow, though more slowly. Not until the 22nd century do the projections show population stabilizing. At that point, world population will probably be well above 10 billion.

Changes in the projections

Table 3 indicates that these projections involve important changes since the 1980 projections, but only minor changes since last year.

Since 1980, the world population for the year 2000 has been revised upward by 2 percent, because of a substantial upward revision for Africa and a smaller upward revision for Asia, only partly balanced by downward revisions for America and Europe. The current projections give a population for the entire continent of Africa in the year 2000 that is 8 percent larger than in the 1980 projections. This is based on ample recent evidence that fertility levels are more resistant to change than had earlier been assumed. For Asia, the change in the projections mainly concerns China. A recent upswing in the birth rate makes it less likely that Chinese fertility will soon dip below replacement and stay below for an appreciable period. In contrast to Africa, Latin America has shown larger fertility declines than previously projected. For Europe and other developed countries, the revision has mainly involved stretching out the period of below-replacement fertility.

Table 3. Population in 2000 and Stationary Population by Geographic Region and for Selected Countries (millions)

Geographic region or country	Projection of 1980		Projection of 1987-88		Current projection	
	Population in 2000	Stationary population	Population in 2000	Stationary population	Population in 2000	Stationary population
World	6,075	9,867	6,176	10,650	6,205	10,806
Africa	805	2,071	875	2,531	872	2,506
America	847	1,267	824	1,216	825	1,224
Asia	3,561	5,569	3,634	5,974	3,657	6,087
Europe and U.S.S.R.	833	922	818	888	821	882
Oceania	28	38	29	41	29	40
Selected countries						
China	1,251	1,555	1,274	1,683	1,279	1,695
India	973	1,644	996	1,678	1,002	1,698
Indonesia	203	350	212	363	211	356
Brazil	201	345	178	292	180	306
Nigeria	153	425	163	529	163	529

These revisions have affected the projected stationary populations dramatically. The eventual stationary world population now appears almost 10 percent greater than it did in 1980. For Africa in particular, the projected stationary population is now 21 percent larger than in the 1980 projections.

Aggregate changes since last year's projections, on the other hand, are minor. Projected world population in the year 2000 is up half of 1 percent this year as compared with last year. The largest revision for a geographic region is for Asia, but is barely above half of 1 percent.

Projections for practically all countries have changed, but in the majority of cases only minimally, and about as often upward as downward. The larger changes have been due more often to revisions in current demographic indicators rather than to revisions in assumed future trends. Current indicators may have changed, for instance, because of new data or new analysis of census or survey data. Revised current population estimates account for new projections for countries like Swaziland, Costa Rica, Jamaica, Peru, and Papua New Guinea. Revised fertility estimates, often from Demographic and Health Surveys, account for new projections for countries like Nepal, Pakistan, Bolivia, Guatemala, and Nicaragua.

Comparisons among World Bank regions

The four World Bank regions, comprising all the borrower countries

Figure 5
Annual Growth Rates, 1985-90 and 2000

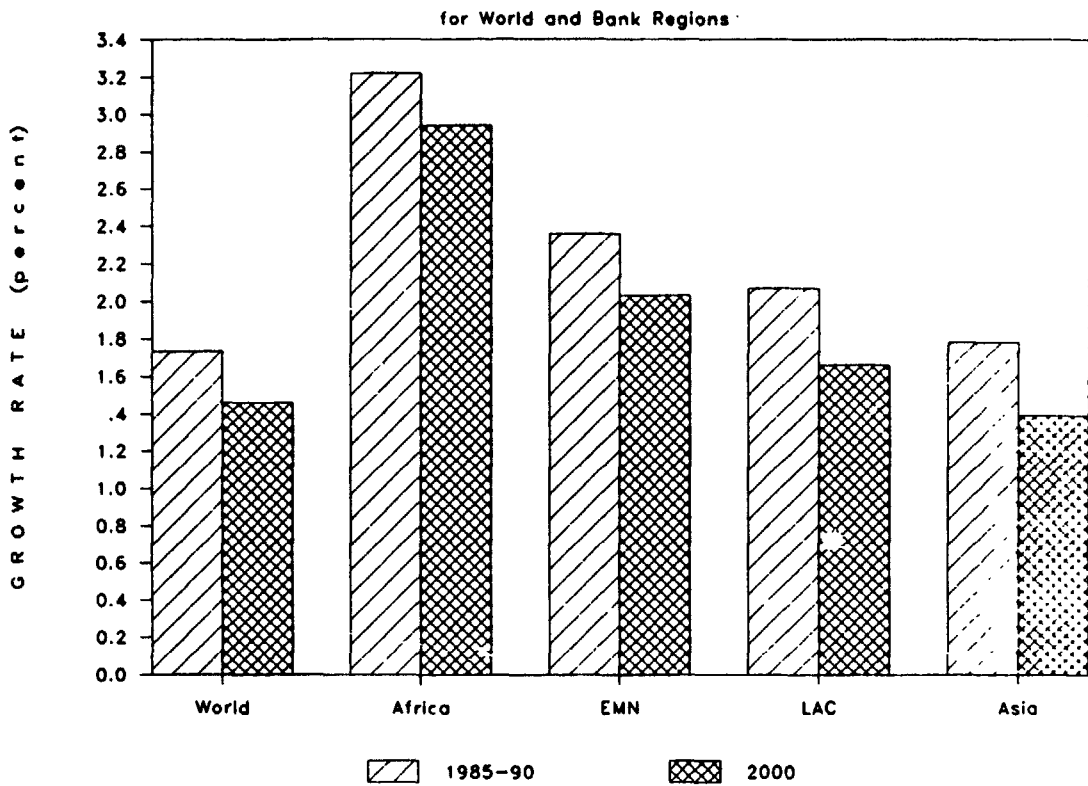

Figure 6
Contribution to World Population Growth

(listed in Table 14), together include 75 percent of the world's population. The regions have markedly different demographic characteristics and growth prospects (Tables 4-7).

At one extreme is the Africa region: with projected high fertility, mortality, and growth rates, it should double in population in 20 years. The stationary population will be four-and-a-half times the present total, assuming that all the sub-Saharan countries reach replacement level (essentially two-child families) within 50 years. If this goal is not reached, the eventual stationary population could be too large for any planner to contemplate. If, after 50 years, four-child rather than two-child families are attained, the African population in the mid-21st century would instead be eight times its current size.

At the other extreme from Africa is the Asia region. As a result of low fertility in China, the Asian growth rate is low. With projected trends, the population will not double for 120 years.

The Latin America and the Caribbean (LAC) region has the lowest mortality among the regions, and, partly as a result, has higher growth than Asia. Its total population is likely to double by around 2040. Its stationary population will be more than twice the current total.

The Europe, the Middle East, and North Africa (EMN) region is demographically two distinct subregions. The European part has fertility and growth rates among the lowest in the world, but crude mortality slightly higher than in other subregions because of an older age structure. The Afro-Asian part has growth rates closer to those of the Africa region. Here, however, the fast pace of population growth is attributable to relatively high birth and low death rates. The total population of the EMN region is expected to double by 2025.

Population growth rates today and in the year 2000 are shown in Figure 5. The African growth rates stand out. Like rates in the other three regions, African growth rates decline, but less than elsewhere. By the year 2000, Africa will still be growing substantially faster than any other region is growing today. Eventually, the Africa region, despite now comprising only 9 percent of the world's population, will be contributing more to world population growth than any other region.

The Asia region now has more than half the world's population and contributes half the world's annual population growth. By the year 2000, Asia will be contributing 4 percentage points less of annual growth, and Africa's share will have increased by 5 percentage points. These relative contributions can be traced out further into the future (Figure 6). The Asian contribution is projected to drop until the mid-21st century, to 30 percent, and then rebound slightly. The African contribution will be rising until the mid-21st century, approaching 45 percent, before falling and rising again. These fluctuations essentially reflect the lag in Africa's demographic transition. Late in the 22nd century, by these projections, most world population growth will be taking place in Africa.

Figure 7
Crude Birth and Death Rates, 1985-90
by Country Department

Figure 8
Total Fertility Rate, 1985-90
by Country Department

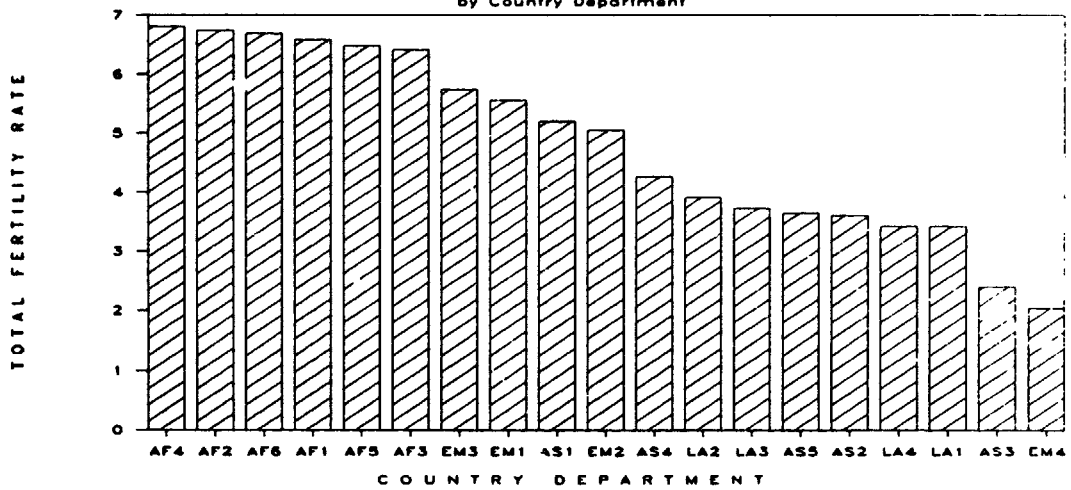

Figure 9
Life Expectancy, 1985-90
by Country Department

Country departments within regions are fairly homogeneous in the Africa and LAC regions, more varied in Asia and EMN. Tables 4-7 provide the numbers and Figures 7-9 represent selected demographic indicators (see Table 14 for the countries in each department). The six Africa country departments have higher total fertility rates and lower life expectancies than any other country departments. Among these others, relatively high total fertility rates and low life expectancies are shown in three of the four EMN country departments (excluding the European department) and in the India and Other South Asia departments. Although fertility and mortality are projected to fall across the board, changes in these rankings of the country departments are expected to be minor for many decades.

Geographic regions and income groups

Tables 8 to 10 present summaries for geographic regions, defined similarly to those used by the U.N., and for income groups (Table 15 lists countries by group). The geographic summaries are parallel to those just discussed, and require no further elaboration. A brief comment is appropriate on the low-income countries.

Of the 186 countries, economies, territories, or small-country groupings in these projections, 46 are classified as low income, with per capita incomes of US\$425 or less (World Bank 1988). These low-income countries, most of them in sub-Saharan Africa and South and Southeast Asia, include almost half the world's population. If China and India are excluded from the group, the remaining countries will have a population growth rate of 2.8 percent, doubling in 25 years. Total fertility is very high in these remaining countries, averaging above six and likely to decline only to five by the year 2000. In that year, all developing countries combined will have a total fertility rate of 3.2. The potential for substantial and sustained population growth in the low-income countries is considerable, and may impose a growing and long-lasting burden on their economies.

Some country results

Table 11 summarizes the population estimates by country, and Figures 10 and 11 show the ten countries in each Bank region with the highest fertility and the lowest life expectancy. (To complete the picture, the smallest countries or territories, those grouped under "Other," are listed in Table 12.)

The current picture across countries--to pick out highs and lows--is this:

- o China has the largest population.
- o India contributes most to the world's population growth.
- o Rwanda, Kenya, and Malawi have the highest total fertility.
- o Qatar has the highest growth rate.
- o Afghanistan and Guinea-Bissau have the lowest life expectancy.

As a result of differential growth, the demographic picture will be somewhat different in the future. For instance, by 2025, Nigeria should replace the

Figure 10
Ten Highest Country TFRs, 1985-90
in Each Bank Region

Figure 11
Ten Lowest Country E(0)'s, 1985-90
in Each Bank Region

U.S.A. as the 4th largest country in the world, and the population of the African continent (including North Africa), now only 75 percent of that of Europe and the U.S.S.R. combined, will instead become 75 percent larger than Europe and the U.S.S.R.

Table 13 represents a more distant future, some time in the 22nd century, when all countries are projected to have reached stationary populations. At this point, India will be slightly larger than China (excluding Taiwan). Nine of the ten largest countries today will still be among the ten largest, but rankings will have changed. The U.S.S.R. will have fallen from 3rd to 5th and the U.S.A. from 4th to 9th, just ahead of Ethiopia. Nigeria and Pakistan, now 9th and 10th, will replace the U.S.S.R. and the U.S.A. as 3rd and 4th. Japan will fall all the way from 7th to 19th. Its stationary population will be smaller than that of countries like the Philippines, Iran, Kenya, and Tanzania.

Projected regional changes are also substantial, with the African continent accounting for 24 instead of its current 12 percent of the world total, and Europe and the U.S.S.R. for only 8 instead of 16 percent.

Clearly, some countries will grow tremendously if this scenario is attained. Rwanda will be six-and-a-half times its current size; Kenya and Malawi will be about six times their current sizes; and 19 other sub-Saharan countries will have at least five times as many people as they have now. Outside sub-Saharan Africa, only two small countries are projected to achieve such growth.

Conclusion

These projections have been showing for several years that an increasing number of people are being added to the world population. World population growth rates may have fallen off slightly, but, as the base enlarges, the numbers added every year still continue to rise.

For Africa in particular, growth rates remain very high. Even assuming eventual declines in fertility similar to those in other regions-- as these projections assume--African countries will soon have to cope with much larger populations, and the world as a whole with substantial rearrangement of demographic potential and demographic problems among countries.

Like all projections, these depend on various assumptions that have been spelled out above. Some demographic trends could certainly be altered, but the scope for alteration is not unlimited, and in many cases very substantial effort will be required.

Notes: When a source for an estimate is directly cited (e.g., UNPVS 4/87), the estimate is taken as is from that publication. When an estimate is "based on" a source, the estimate is not reported in but derived using data in that publication. When a source is given for a fertility or mortality estimate prior to 1985-90, the source for the corresponding 1985-90 estimate is a projection using the earlier estimate. Citations for the main documents referred to here (usually by abbreviations) are in the list of references.

* Nature of population estimate: F = de facto; J = de jure.

-- No census, or no fertility or mortality estimates and no projections made (the latter for small countries).

a Census was for entire peninsula.

b 55 people.

CBR Crude birth rate.

CDR Crude death rate.

Celade Centro Latino Americano de Demografía (1987).

DHS Demographic and Health Survey.

INED Institut National d'Études Démographiques (Monnier 1987).

TFR Total fertility rate.

UNPVS United Nations, Population and Vital Statistics Report.

USBOC United States, Bureau of the Census (1985).

Note: Crude birth rates (CBR) and crude death rates (CDR) are per 1,000 population; total fertility rates (TFR) and net reproduction rates (NRR) are per woman 15-49 years of age; life expectancy at birth, E(0), is given in years; and infant mortality rates (IMR) are per 1,000 live births.

(a) "More developed" comprises Europe, U.S.S.R., Northern America (United States and Canada), Australia, New Zealand, and Japan. "Less developed" comprises the rest of the world.

(b) Criteria for income groups are given in World Bank 1988. See listing in Table 15 of this paper.

Table 15. Countries and Economies Classified by Income Group (based on GNP per capita in 1986 U.S. dollars)

Low income (\$425 or less)

East Africa	West Africa	South Asia
Burundi	Benin	Afghanistan
Comoros	Burkina Faso	Bangladesh
Ethiopia	Central African Rep.	Bhutan
Kenya	Chad	India
Lesotho	Equatorial Guinea	Maldives
Madagascar	Gambia, The	Nepal
Malawi	Ghana	Pakistan
Mozambique	Guinea	Sri Lanka
Rwanda	Guinea-Bissau	
Somalia	Mali	East and Southeast Asia
Tanzania	Mauritania	Burma
Uganda	Niger	China (excluding Taiwan)
Zaire	São Tomé and Príncipe	Kampuchea, Dem.
Zambia	Senegal	Lao People's Dem. Rep.
	Sierra Leone	Viet Nam
North Africa	Togo	
Sudan		Oceania
	Latin America and the Caribbean	Vanuatu
	Haiti	

Lower-middle income (\$426-\$1,000)

East Africa	Latin America and the Caribbean	Southwest Asia
Botswana	Belize	Gaza Strip
Djibouti	Bolivia	Jordan
Mauritius	Chile	Lebanon
Namibia	Colombia	Syrian Arab Rep.
Swaziland	Costa Rica	Turkey
Zimbabwe	Dominica	Yemen Arab Rep.
	Dominican Rep.	Yemen People's Dem. Rep. of
West Africa	Ecuador	
Cameroon	El Salvador	East and Southeast Asia
Cape Verde	Grenada	Indonesia
Congo, People's Rep. of the	Guatemala	Philippines
Côte d'Ivoire	Guyana	Thailand
Liberia	Honduras	
Nigeria	Jamaica	Oceania
	Nicaragua	Kiribati
North Africa	Paraguay	Other Micronesia
Egypt, Arab Rep. of	Peru	Pacific Islands
Morocco	St. Kitts and Nevis	Papua New Guinea
Tunisia	St. Lucia	Solomon Islands
Other North Africa	St. Vincent and the Grenadines	Tonga
		Western Samoa

Table 15 (continued)

Upper-middle income (more than \$1,800)

East Africa	Latin America and the Caribbean	Southwest Asia
Réunion	Antigua and Barbuda	Cyprus
Seychelles	Argentina	Iraq
South Africa	Bahamas	Israel
	Barbados	Oman
West Africa	Brazil	
Gabon	Guadeloupe	East and Southeast Asia
Other West Africa	Martinique	Brunei
	Mexico	Hong Kong
North Africa	Montserrat	Korea, Rep. of
Algeria	Netherlands Antilles	Macao
	Other Latin America	Malaysia
Europe	Panama	Singapore
Greece	Suriname	Taiwan, China
Hungary	Trinidad and Tobago	
Malta	Uruguay	Oceania
Other Europe	Venezuela	Fiji
Poland	Virgin Islands (U.S.)	French Polynesia
Portugal		Guam
Romania	South Asia	New Caledonia
Yugoslavia	Iran, Islamic Rep. of	Other Polynesia

High income (oil exporters)	Southwest Asia	Southwest Asia (cont.)
North Africa	Bahrain	Saudi Arabia
Libya	Kuwait	United Arab Emirates
	Qatar	

Industrial market economies	Europe (cont.)	Northern America
Europe	Italy	Canada
Austria	Luxembourg	United States of America
Belgium	Netherlands	Puerto Rico
