**NON-TARIFF MEASURES:
WHAT DO WE KNOW, WHAT SHOULD BE DONE?**

by

Céline Carrère
CERDI-CNRS

and

Jaime De Melo
University of Geneva and CERDI

December 2009

Abstract

With the reduction in tariff barriers, Non-tariff and behind-the-border measures (NTM and BTB) have increased in importance. This paper surveys the state of knowledge with the view to drawing implications for policy suggestions to reduce those NTM barriers that are welfare reducing. Following a description of data bases and their shortcomings, the paper reviews the state of understanding on the effects of NTMs on trade flows. The more difficult issue of translating these effects into welfare implications are covered next. The paper concludes with different approaches at reducing NTMs.

Glossary of Abbreviations

AFTA	Asian Free Trade Area
APEC	Asia Pacific Economic Cooperation (21 countries in the Asia Pacific region)
AVE	Ad valorem equivalent
BTB	Behind-the-border measures that include
CODEX	Codex Alimentarius Commission
EBA	Everything but Arms initiative of the EU giving duty-free quota-free access to LDCs in the EU market
HS	Harmonized system
DCs	Developing countries (other than LDCs)
DSU	Dispute Settlement Understanding
FTAs	Free-trade Areas
GSP	Generalized system of preferences
IOE	International Office of Epizootics
IPPC	International Plant Protection Convention
LDCs	The list of 50 Least-developed-countries
MFA	Multi fiber agreement
NTBs	Non-tariff barriers (subset of NTMs that are welfare-reducing)
NTM	Non-tariff measures
OTRI	Overall Trade Restrictiveness Index
PTAs	Preferential trade agreement (often non-reciprocal such as GSP or EBA)
PSRO	Product Specific rules origin usually defined at the HS-6 level
QRs	Quantitative Restrictions
RIA	Regional Integration Agreement
RoO	Rules of Origin
S&D	Special and Differential Treatment for LDCs (longer time frame to adjust to new rules complement by TA)
SPS	Sanitary and phytosanitary measures
TA	Technical Assistance
TF	Trade Facilitation negotiations
VER	Voluntary Export Restraint
WTS	World Trading System

1. Introduction

The evidence on the various barriers to trade--natural and policy related--points to high 'trade costs' which have been invoked to explain several puzzles in macroeconomics (see Obsfeld and Rogoff, 2000). The growing literature is also struggling to come up with better estimates of these trade costs and, for those that are policy-imposed, which ones are 'actionable', i.e. are welfare-decreasing and could be eliminated or reduced by policy action. Take two examples. The costs associated with cross-border trade between two well-integrated countries, the US and Canada, have been estimated to be as high as 70% (see Anderson and Van Wincoop, 2004).¹ Another literature on the patterns of bilateral trade is still to resolve the distance puzzle (why low-income countries do not expand trade in old and new products with partners further away in the recent decades in spite of a decline in transaction costs).²

'Trade Costs' are usually defined as the sum of administrative barriers, trade policies - tariffs and non-tariff measures (NTMs) - and transaction costs (transport and insurance costs). Sometimes the literature also refers to behind-the-border (BTB) measures to distinguish those trade costs that are not the result of trade policies.³ The conclusion of the Uruguay Round has resulted in the tariffication of agriculture support measures and the elimination of the MFA, quotas, VERs and traditional other welfare-reducing NTMs (because they reduce welfare, these measures are often called NTBs) are out of the picture. As a result, attention has focused on the extensive array of NTMs and BTB measures which are part of 'trade costs'.

¹ If these estimates seem high, they are confirmed by recent estimates of the 'border effect' based on homogenous products. Using detailed data at the Universal Product code level for 1800 stores for a large retail chain on both sides of the US-Canada border and for close to 40 million products, Gopinath et al. (2009) find that for some products a retail price discontinuity as high as 21% for stores on either side of the border while it is close to zero for stores on the same side of the border.

² See the discussion and evidence in (Berthelon and Freund, 2008, Carrère et al., 2009, Disdier and Head, 2008). Regardless of the magnitude of the 'puzzle', it is surprising that the average distance of trade for low-income countries has fallen significantly over the last thirty years.

³ The terminology 'BTB measure' was first used to distinguish between 'deep' and 'shallow' integration in Regional Integration Agreements, 'deep' integration occurring when integration extends beyond the removal of protection (i.e. integrating factor markets, combining regulatory institutions, harmonizing standards and cooperating intensively on trade facilitation, e.g. reducing 'red tape' for crossing borders).

NTMs are often defined by what they are not (i.e. as all measures except tariffs—see box 1). Some are covered in the WTO agreements⁴, but these are measures for which disciplines are minimal (countries only have to notify changes to the WTO to increase transparency, and many countries do not notify these measures). Most efforts at reducing NTMs have either occurred unilaterally or (mostly) at the regional level and there has been little progress at harmonization on a multilateral level.

As to BTB measures, they are not covered in WTO but, evidence suggests that they represent significant barriers to trade (all forms of transaction and administrative costs, including transport-related costs). While it is difficult to get an informed appraisal about the relative importance of NTMs vs. BTBs as barriers to trade, there is general agreement that BTBs are increasing in importance and that BTBs are the most important barrier to trade for many small landlocked or isolated economies (see Shepherd and Wilson, 2006, and Hoekman and Nicita, 2008) .

From the point of view of gaining a better understanding of the importance of NTMs and of what to do about them, this note deals with three related questions that should help guide policies towards NTMs:

- How important are NTMs, i.e. what impact they have on trade flows? Which have been identified as most significant (across sectors, countries)?
- Which NTMs are justifiable, and for those that are not (some say NTBs, or uninformative rather than informative NTMs) what can be done?
- What approaches have been or could be used to remove NTBs.

Answering the first question helps focus on the NTMs that are binding, i.e. on those that reduce the volume of imports. This is a first step towards identifying that would be considered for policy action if they are found to be non-informative or welfare-reducing. The second, and more difficult issue, is the determination of the NTMs that are likely to be welfare-reducing. The discussion is necessarily general, reflecting the difficulty of detecting which NTMs are welfare-reducing. This leads naturally to a discussion of approaches used to remove NTBs.

This note is complementary to our companion note (Carrère and de Melo, 2009) which surveys methods and main results on measurement of the effects of NTMs. Section 2 summarizes the growing number of data bases that are coming on stream and should help developing better diagnosis. Section 3 reviews the different approaches used to detect the effects of

⁴ NTM provisions covered in the WTO agreements are : (i) article VII on customs valuation ; (ii) TBT agreement ; (iii) SPS agreement ; (iv) rules on import-licensing procedures ; (v) rules of origin ; (vi) PSI ; (vii) TRIMs ; (viii) State-trading enterprises ; (ix) Trade remedies.

NTMs on trade flows and highlights some of the main results from these studies. Section 4 discusses the welfare implications of NTMs using illustrative examples. Section 5 reviews the alternative approaches at national, regional or multilateral levels to remove NTMs that are identified as welfare-reducing.

2. Data on NTMs

Extensive data base: UNCTAD TRAINS-WITS data base

Until recently, the UNCTAD Trade Analysis and Information System (TRAINS – accessible via WITS) data base was the only extensive data base covering NTMs for a large number of countries, mainly allowing the computation of frequency and coverage ratios. It has given rise to several classifications (see box 1), but this database presents two main limitations.

First, it is dated (the data base has not been updated since 2001) and quite incomplete (a lot of missing values). As explained in detail in the annex 1, the data base is supposed to cover 165 countries since 1988, but in effect only 100 countries have more or less reliable data for the period 2000-2001. One of the problems in the data base is that the missing entries at the HS-6 level may either refer to missing data or to no NTM on that tariff line. Hence, the interpretation of frequency and coverage ratios is subject to the caveats that much of the missing information is difficult to interpret (does no entry at the HS-6 tariff line level mean no NTM or does it represent missing data?).

With the growing importance of NTMs as barriers to trade, awareness of the deficiencies of existing data bases has grown and data collection efforts are under way. A joint UNCTAD/WTO (ITC) project is underway to put together a new data base that will include two components: an enhanced official component much like in the current WITS-TRAINS data base but for more measures (see details in box 2), and also a subjective component based on detailed interviews for representative samples of exporting companies (about 400 per country).⁵

The second main limitation of UNCTAD TRAINS relates to the frequency and coverage ratios reported in this database which are not informative on the restrictiveness of the NTMs considered. An interesting and useful extension of the UNCTAD TRAINS-WITS data base is the set of World Bank Overall Trade Restrictiveness Indices (OTRI) also covering a large number of countries for years around 2000. The general objectives of these indices are first to build more comprehensive indicators of trade restrictiveness that include measures of both tariff and non-tariff

⁵ For preliminary results from a sample of 5 pilot countries, see Mimouni et al. (2009) and section 3.

measures; and second to allow exploring differences in the level of trade protection vis-à-vis different groups of countries (low-income, middle-income, least-developed countries). However, these indices, discussed at greater length in our companion, have the same shortcomings that the UNCTAD TRAINS data base.

Box 1

Existing Categorization of NTMs*

NTMs are broadly defined as any measure that causes a trade distortion but is not a tariff whereby a distortion exists when the domestic price differs from the border price. These include export restraints and export subsidies and the distortions can be intentional (e.g. a QR) or a side effect of a legitimate regulatory measure (e.g. a sanitary measure). If it is imposed explicitly to protect domestic industry by restricting import demand, it is also known as an NTB. Distortions mostly arise from government-imposed measures, but can also be due to restrictive business practices. An NTB also includes internal (i.e. behind-the-border) measure such as a production subsidy and the many juridical and administrative measures covered under the Trade Facilitation negotiations of the Doha Round .

Three classifications have been developed: (i) UNCTAD-TRAINS which uses the Trade Control Measures Coding System (TCMS) broken down into six categories: price control measures, finance measures, automatic licensing, quantity control measures, monopolistic measures and technical measures (it excludes measures applied to exports and production) – this classification is in the process of being updated (see details on the classification in Box 2); (ii) the WTO NAMA classification based on the 800 measures that members must notify to the WTO under the individual agreements---SPS, TBT,AD--- (government participation in trade, customs and administrative procedures (rules of origin), TBTs, SPS, Specific limitations (quotas), charges on imports (IPRs and safeguards) which is periodically incorporated in the UNCTAD data base; (iii) the Deardorff and Stern (1997) classification which covers much the same ground as the other two but includes as well a broad range of macro policies (including FDI policies, national policies, foreign exchange policies and corruption).

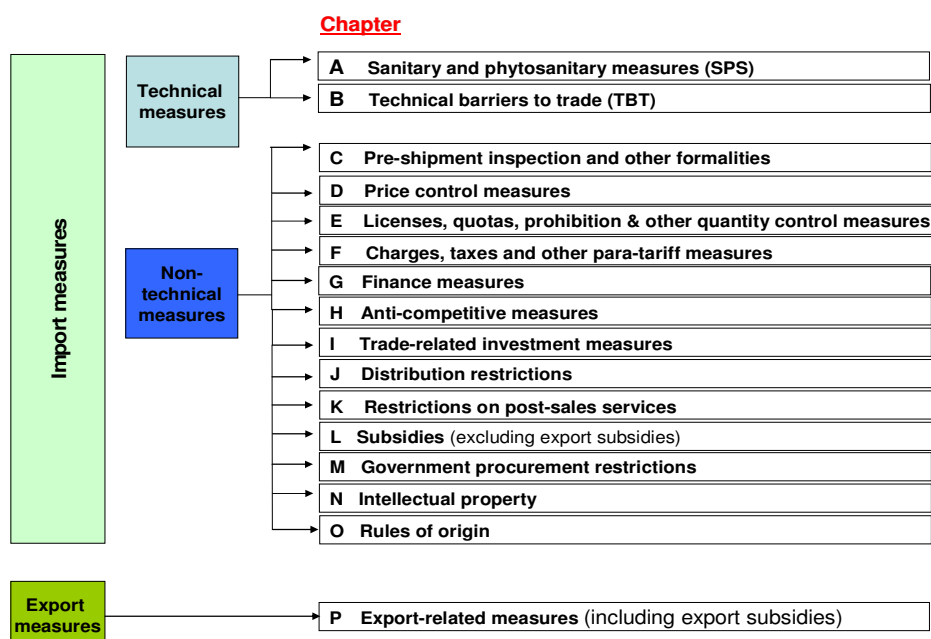

With the elimination of the MFA and the tariffication of agricultural support policies into two-tier tariff schemes, the number of tariff lines ridden with quantity and price controls has fallen from 45% in 1994 to 15% in 2004 while the use of TBT has almost doubled from 32% to 59%, with technical regulations are the most frequent important NTM.

* For elaboration, see World Bank (2008a), Beghin (2006), and Hoekman and Nicita (2008).

Box 2**New classification of NTMs***

The only internationally available cross country database on NTMs is the UNCTAD -TRAINS database. However, this database has not been updated since 2001 and the data is based on an obsolete classification which does not accurately cover new forms of non-tariff measures. In 2006, UNCTAD established the Group of Eminent Persons on Non Tariff Barriers (GNTB) to discuss definition, classification, collection and quantification of non-tariff barriers so as to identify data requirements, and consequently to facilitate the understanding of the implications of NTMs (defined as “*policy measures, other than ordinary customs tariffs, that can potentially have an economic effect on international trade in goods, changing quantities traded, or prices or both*”).

The new proposed classification of NTMs follows a hierarchical "tree" structure where NTMs are differentiated according to 16 "branches" or chapters (denoted by alphabetical letters), each comprising "sub-branches" (1-digit), "twigs" (2-digits) and "leaves" (3 digits). This classification drew upon the existing, but outdated, UNCTAD Coding System of Trade Control Measures (TCMCS) classification on NTMs, and has been modified and expanded by adding various categories of measures to reflect the current trading conditions.

The updated classification includes a substantial number of new sub-categories on sanitary and phytosanitary (SPS) measures and technical barriers to trade (TBT), and introduced a few new categories of NTMs such as “export measures”, “trade-related investment measures”, “distribution restrictions”, “restrictions on post-sales services”, “subsidies”, “measures related to intellectual property rights” and “rules of origin”. The classification also introduces the concept of “procedural obstacles”, which refers to issues related to the process of application of an NTM, rather than the measure itself (collected through survey data).

* Based on the Multi-Agency Support Team “Report to the Group of Eminent persons on Non-Tariff Barriers” (draft/September 2009).

Specific NTM data bases

A growing number of more specific new data bases are becoming available. These include a global Anti-dumping data base, a data base on EU standards, the WTO Sanitary and Phytosanitary (SPS) Measures – Information Management System (SPS-IMS) and several data bases on trade facilitation measures. Annex 1 gives a short description of these data bases. Table A1.1 summarizes this information and gives links to access these data.

Country Cases Survey/Interview data bases

In their early influential study, Deardorff and Stern (1997) noted that “there is no substitute for NTB and sector-specific expertise. The reliability of any measure of NTBs that may be constructed for particular sectors is limited by the knowledge of the intricacies of those sectors that bear upon the measures”. Case studies aim at providing this knowledge necessary to classify NTMs so as to be better informed on which ones are informative (should be kept from a welfare point of view as e.g. certain prohibitions or technical regulations for health, security or environmental reasons). We review here briefly the two recent initiatives to collect case studies data (World Bank, 2008a and 2008b and UNCTAD/WTO (ITC), 2009)

The World Bank study (2008a) carried out firm and governmental official interviews in thirteen countries (Cambodia, Chile, China, Indonesia, Korea, Laos, Mexico, Singapore, Thailand, Taiwan, Peru, Vietnam). The objective was to get an idea of the potential for export expansion if these countries were to face less restrictive NTMs in their main export markets. The interviews were carried out with government officials and exporter associations and/or firms in an informal manner and varied greatly across countries. For example 23 interviews were conducted in Cambodia, two with exporter associations, the rest with government officials, while in Mexico it was taken from a data base in Mexico’s export-import Bank, while in Korea the interviews were administered to 1000 respondents that included firms and embassies.

Another similar study for East Africa was also conducted by the World Bank (2008b). The task team conducted country-by-country consultations with member governments and private sector firms (producers/exporters/importers/transporters) with an effort to focus specifically on NTMs that constrain “only” the intra-region trade of EAC members. However, the discussions with firms often had to include their sale in other parts of the country and beyond the region (in Sub-Saharan Africa, especially the Democratic Republic of Congo).

The other data base initiative is the one of UNCTAD/WTO/ITC discussed above (see also box 2). Actually, in addition to official data collection, the project proposes to collect data from the private sector by conducting firm level surveys and by providing a web based application to facilitate data collection from private companies.

As described in the Report of the Multi-Agency Support Team (2009), the primary scope of survey data collection is to obtain information on NTMs that poses particular burdens for private firms. This approach provides useful information because the presence of a large number of complaints gives an indication of the existence of a particularly restrictive NTM (see the first results for the 7 pilot countries reported in next section). However, the survey data collected is of limited use for statistical analysis. First, it always remains a difficult task to interpret the implications of subjective statements. Perceptions may vary according to the knowledge of the person interviewed, or according to the recent experience the person had. Perceptions are also likely to vary across countries in a given sector. Perceptions will also be different in countries with a strong social infrastructure (where meeting SPS and TBT standards will be easier) from those in countries with a weak social infrastructure.

Moreover, in general the sample surveys are not representative of the country's overall exports (some sectors are excluded *a priori*), or even of sectoral exports (large firms are excluded). Hence, as recognized by the Multi-Agency Support Team (2009), there are problems of endogeneity due to selection bias as firms that are not likely to report problems are excluded, but also because the incentives of firms in reporting NTMs is likely to be correlated with their capability in complying with the measure. These problems make survey data poorly suited for cross country comparison, and problematic to use in combination with other data sets such as tariffs or bilateral trade flows.

3. Measuring the effects of NTMs on trade flows: What Does the Data tell us?

Results based on the UNCTAD TRAINS-WITS data base or Specific NTM data bases

As shown in the annotated bibliography in annex 2, until recently most assessments on NTMs has relied on computing "frequency" and "coverage" ratios, most often using the WITS-TRAINS where the NTMs are entered as binary (zero-one) variables. For well-known reasons these indicators, while a useful description of the landscape, are insufficient to serve as proxies of the effects of these NTMs since these ratios are outcome

variables: a low frequency or coverage ratio could represent a very stringent NTM measure.

A more systematic analysis of the effects of NTMs has focused on evaluating their ad-valorem equivalents (AVEs), i.e. on estimating the tariffs that would result in the same reduction in imports as those attributed to the NTMs. The large majority of studies have concentrated on one of two approaches.⁶

The first approach uses the gravity model often focusing on the effects of NTMs on the volume of aggregate bilateral trade. For the purpose at hand, which is to detect the effects of NTMs at the product level where they are imposed, the gravity model has several drawbacks. First, it works better for aggregate trade than for trade at the product-line level. This makes it ill-suited for the analysis of NTMs which are usually defined at the product-level. Such estimates then need to be carried out at the most disaggregated product level possible. Second, any NTM is usually imposed on imports regardless of their origin while the gravity model seeks to explain bilateral trade volumes making it difficult to identify the effects of NTMs on bilateral trade as shown by the lack of robustness of results to the choice of NTM indicator (see box 3).

⁶ Another approach, much less used, relies on price comparisons. It is very demanding because ideally it requires data at the product level (e.g. at the universal product code level as in Gopinath et al., 2009). This precludes using the approach for a larger number of countries and products.

Box 3
SPS and TBT Agreements: Effects on Agricultural Trade*

Under the WTO SPS and TBT Agreements, members can adopt regulations which may influence significantly trade flows, either positively when these regulations provide information to consumer that are safe or negatively if they are used in a protectionist way. Disdier et al. (2008) use the ad-valorem equivalents (AVEs) of Kee et al. (2008) along with a dummy variable or a frequency index to measure the trade impact of SPS and TBT (measures notified to WTO) in 2004 on imports of 690 agricultural and food products. In the sample of 154 importing countries, only 92 reported SPS or TBT measures to the WTO, in each case adding one of six motives for the measure (these data do not have a bilateral) dimension.

In their sample, 260 products have a coverage ratio above 50%. The most frequent barrier is “technical barriers” (i.e product-specific characteristics) with protection of health the most cited motive (human, followed by animal and plant). For 20 products, less than 5 countries impose a measure on that product, perhaps an indicator of a protectionist intent for those country-product pairs.

Across OECD importing countries, there is a large variance in coverage ratios (for example, Japan has a coverage ratio of 23% while Australia, Mexico, New Zealand, Norway and the US have coverage ratios above 50%. When using the coverage indicator, developing countries are the most affected while it is developed countries when the ranking is by number of products affected.

Gravity-based estimates at the HS-4 level for OECD countries indicate that, after controlling for others correlates of bilateral trade, each one of three indicators (dummy variable, frequency index or AVE) reduces significantly bilateral imports. When disaggregating exporters into three groups (OECD, DCs and LDCs), they find that OECD exports are more significantly affected by tariffs than DCs or LDCs. When it comes to SPS and TBT measures, DCs and LDCs export volumes to OECD countries are negatively correlated with the index particularly when it comes to export to EU markets who notify fewer SPS and TBT measures than other OECD countries (except Korea and Turkey). At the subsector level (HS-2), they find statistically significant negative coefficients for one third of the sectors, and statistically significant positive coefficients for another third, the remainder being insignificant. However, the results are sensitive to the choice of NTB measure (dummy variable vs. AVEs). In sum, the study suggests that SPS and TBT measures are more negatively correlated with the exports of DCs and LDCs exports to OECD markets.

* Drawn from Disdier et al. (2008)

The second approach draws on the factor-endowment-based theories of trade focusing on the volume of trade at the product level. In that approach, the volume of aggregate trade is correlated with factor endowments, country characteristics, tariffs and various proxies of NTBs. While it has advantages for a study of the effects of NTMs at the product level, it too has drawbacks as idiosyncratic measurement errors, likely to cancel out at the aggregate level, will be magnified at the HS-6 product-line level and relevant control variables are missing. Finally, the estimate of the price elasticity of demand for imports, which is essential for computing the AVE, will likely change in magnitude with the sample period.

Subject to the doubtful quality of the data, the survey in our companion paper of the growing number of studies various data bases suggest: (i) NTM restrictiveness estimates based on an aggregate of 'core' NTMs are more restrictive than existing tariffs and, because of their export composition towards agricultural products, these 'core' NTMs limit market-access most for low-income countries; (ii) subject to the included controls, NTM indicators are systematically correlated negatively with bilateral trade volumes; (iii) harmonization of standards is trade enhancing; (iv) for single-NTM products (74% of tariff lines only have one NTM measure) have an AVE of around 40% which is higher than the tariff on the corresponding line; (v) the restrictiveness of technical regulations increases with income per capita.

Results based on Country Cases Survey/Interview data bases

First, we look at the World Bank study on thirteen countries (Cambodia, Chile, China, Indonesia, Korea, Laos, Mexico, Singapore, Thailand, Taiwan, Peru, Vietnam). Taken together, the thirteen case studies suggest that NTMs are particularly costly for agricultural products not only because the SPS standards vary across countries, but also because compliance costs related to certification are high as the necessary infrastructure to carry them out were found to be lacking in the countries in the sample. These costs are compounded by the cost-raising effects on perishables due to inefficient customs procedures. For manufactures, steel, chemicals, and plastics are often subject to Anti-dumping measures. Finally the interviews in the surveys indicate that arbitrariness and non-transparency plague exporters to developing countries, be it with respect to customs procedures or product standards. For exporters of these developing countries to the EU, US and Japan, the major obstacle is the complexity and level of detail in the trade procedures. Stringent Rules of Origin are often perceived as a significant barrier.

For the 5 EAC countries, the task team (World Bank 2008b) presents the NTMs that apply to intra-EAC trade, with the broad categories organized as per the WTO inventory categorization which are ranked in a decreasing order of importance and based on the numbers of private sector complaints from their interviews in the 5 EAC economies. They obtain the following ranking: a) Customs and administrative entry and passage procedures; b) Government participation in trade and restrictive practices tolerated by it; c) Distribution restrictions; d) Specific limitations; e) Technical barriers to trade and f) Sanitary and Phyto-Sanitary Measures.

We turn now to the first results based on the UNCTAD/WTO (ITC) pilot study (only for the private sector data) described previously (and in Box 2). As well described in Mimouni et al. (2009), In January 2008, the ITC and the UNCTAD launched a joint 15-month pilot project for the collection and classification of data on NTMs in seven developing countries. In each country, among other activities, a company-level survey with 300 to 400 face-to-face interviews was carried out in order to identify, at the product level, those measures that exporting companies perceive as barriers in their daily business, as well as the reasons why companies experience a measure as burdensome. The following analysis will be based on the survey results for five countries (Chile, the Philippines, Thailand, Tunisia, and Uganda). Results from the surveys in the five countries are reported in table 1.⁷

Table 1. Non-tariff Measures experienced by exporting firms (i.e. declared as “Serious Obstacles to Trade”, %

NTM group ¹	Chile	Philippines	Thailand	Tunisia	Uganda	Simple cross-country average
Technical measures to trade (e.g., product characteristic requirement; production process; conformity assessment)	70.3	76.4	93.5	62.7	64.1	73.4
Pre-shipment inspection and other customs formalities	14.0	3.1	2.3	22.6	23.1	13.0
Licences, quotas, and other quantity control measures	6.1	0.4	2.2	0.5	0.3	1.9
Charges, taxes, and other para-tariff measures	1.2	2.7	0.2	4.7	7.4	3.2
Finance measures regulating the access to and cost of foreign exchange for imports and defining the terms of payment	2.1	0.6	0.1	4.2	0.2	1.4
Other	6.4	16.9	1.6	5.3	4.9	7.0
Total	100.0	100.0	100.0	100.0	100.0	100.0

source : *Mimouni et al. (2009), table 1 in section 1.6.*

While the sample is small, beyond the expected result that technical measures are the most important form of NTM (a result also evident from

⁷ In May 2009 the UNCTAD and ITC conducted a follow-up survey to assess the impact of the financial crisis on NTMs measures in 5 out of the 7 pilot countries. The paper of Skorobogatova et al. (2009) summarizes the results.

the earlier data—see table 4 below), several patterns emerge suggesting variation across regions of destination (perhaps due in to the product composition of exports) . From table 2, it is apparent that Thai exporters reported concerns about technical measures to trade, while Chileans faced licenses and quotas and the African countries expressed concerns about customs formalities and pre-shipment inspection.

Figure 1, also drawn from their study, explores the possibility that NTM barriers vary across destination by reporting the average share of NTMs across destination for the seven most prevailing type of measure (because firms often reported several measures, per-firm averages were computed in a first step). *Certification requirements* are important regardless of destination. Not surprisingly, exporters face barriers related to *customs formalities* in Africa. This is not surprising since tariffs are a more important source of government revenue in that region, but also it is at the customs that rent-seeking activities will endogenously take place in the form of NTMs. In the absence of rent-seeking activities, one might argue that PSI might be warranted, but it is not at all clear that it fulfills its role (see Anson, Cadot and Olarreaga, 2006). So even in this straightforward case, it is not absolutely clear that this NTM is ‘actionable’, i.e. is welfare-reducing. For exports destined to high-income countries, *testing requirements* represent an important obstacle for exporters. Two patterns emerge; (i) exporting to countries in the Africa, Latin America and Caribbean regions face more procedural barriers overall; (ii) for at least three countries (Chile, Thailand and Tunisia), barriers to regional destinations are highest; (iii) further results (not reported here) suggest that many of the problems reported by the firms surveyed relate to domestic barriers ranging from weak customs and administrative procedures as well a lack of local facilities and infrastructure.

Figure 1. Companies' Perceptions of NTMs by Destination, %

source :Mimouni et al. (2009), figure 1 in section 1.6.

These patterns are informative, and useful, partly because they confirm some of the patterns emerging from the larger earlier data set where it is apparent that technical regulations represent the most frequent form of NTMs (see estimations obtained in our companion paper and reported in table 2 below). With a larger sample of countries comparisons to averages will be more meaningful. However, as already discussed in section 2, it will always remain a difficult task to interpret the implications of subjective statements. It may also be difficult to match the results from questionnaires administered to companies to the responses by firms.

To learn more about the effects of NTMs, not only case studies must complement the econometric estimates, but these studies must go beyond interviews and rely on more systematic in-depth data gathering on compliance costs. This is illustrated in the commodity-chain studies summarized in box 4. These results confirm that there is no substitute for sector-specific expertise and that it is difficult to interpret the results from perceptions expressed in ordinal rankings in interviews.

Box 4:**Food Safety and Agricultural Standards***

Fresh and processed fruits and vegetables, fish, meat, nuts, and spices account for over 50% of agricultural food exports of developing countries. A recent study of commodity chains for fish, horticulture, livestock products, nuts and spices in 9 low and middle-income countries reached several generalizable conclusions. (i) SPS constraints include measures imposed by the private sector that are often more stringent than those of the public sector. (ii) In countries with weak institutions and lack of overall competitiveness (administrative financial and other weaknesses), these measures may force exit, but for countries with adaptive capacity, these stricter standards provide a stimulus for investments in supply-chain modernization resulting in more profitable long-term trade. (ii) the complexity of the standards setting for high-value products are likely to increase, especially within the private sector, leading to package together safety, quality, environmental and social standards implying that developing-country stakeholders should participate in the standards-setting process through international organizations, bilateral discussions, or membership in private bodies. (iii) A great diversity in the operative 'rules of the game' subsist in spite a move in the same broad direction, with regulatory systems entailing a mix of old and new requirements that reflect largely different perceptions of risk, scientific traditions and climatic/geographic traditions so that it is difficult to ascertain the cases when standards are protectionist in intent.

The research also shows that compliance strategies to cope with SPS have been successful in many middle-income countries and that coping strategies should move beyond a pure public sector approach to include the private sector. Potential benefits of standards compliance are long-term (there are economies of scale and scope), often intangible (price premiums are not always paid for 'safe' and 'sustainable' products) and the benefits often accrue to others. In many instances, the researchers were able to document the low costs of compliance for those that chose to comply. In many instances the bulk of compliance costs were fixed and often less than 5% of the annual value of exports. The research concludes that for the large array of high-value commodity chains examined, costs were less than assumed, especially relative to the value of exports.

* World Bank (2005)

4. Welfare Effects of NTMs

If measuring the effects of NTMs on trade flows is difficult, with the exception of QRs, VERs and minimum prices whose objectives are to protect domestic industries, detecting their welfare effects is even harder because the measures are complex and hence not easily quantifiable. Most importantly, the NTMs typically have several objectives, with protection a potential objective to be detected since it is hidden. Even in the case of distortionary NTBs, i.e. measures that do not address a market failure such as externalities or asymmetric information, a unified approach to measure their impact does not exist. Typically, measurement is in partial equilibrium at the product level. The analysis then attempts to separate out three effects: (i) the regulatory protection effect that provides rents to domestic producers; (ii) the supply-shift effect reflecting increased costs for foreign, and sometimes domestic, suppliers; (iii) a demand-shift effect which takes into account that the regulation may enhance demand with new information or by reducing an externality.

The three following examples help illustrate the difficulties at quantification. The first illustrates the difficulty in drawing the welfare implications of SPS measures for agricultural products. The second on standards in electronic products applied by the EU, shows that harmonization of standards increases trade, and is likely to be welfare-increasing. The third, on rules of origin in PTAs illustrates that these measures are prone to capture and hence are likely to be welfare-reducing

Suppose a country imposes an SPS measure, and one uses a frequency or coverage measure to approximate the effects of the measure. First, the indicator used for the measure (usually a binary variable) does not capture the potential deterrent effect the measure may have on exporters' pricing and quantity decisions (this is not a problem with a tariff whose objective is just to reduce imports, and perhaps to raise revenue). Second to get the information on the relative value of the affected product, one would want to compute the coverage index on the value of imports that would have occurred in the absence of the measure, which is unobservable. Finally, when one observes the outcome resulting from the adoption of the measure, one is not sure if it is the result of a supply and/or a demand shift (the SPS measure could be informative as consumers learn about the product's characteristics perhaps via required labeling, in which case the demand curve would shift out). It is not surprising then that the results from the bilateral estimates at HS-4 level reported in box 3 are unstable and sensitive to the choice of indicator of NTM. And even if the results were stable one would have difficulty drawing welfare implications without being informed subject to the SPS: for example, a decrease in imports of a

hazardous product following the imposition of an NTM is not welfare reducing as is a reduction in imports following the imposition of a QR, a VER or a tariff.

The effects of product standards on manufactures are also difficult to ascertain since they can have a dual impact on costs. On the one hand they may impose additional costs on exporters who may have to adopt products to the required standards in the importing country. Moreover, a producer wishing to export to several markets may be confronted to idiosyncratic standards specific to each market (in electronics, the EU imposes around 1800 standards, of which two-thirds are international common standards, see Portugal-Perez, Reyes and Wilson, 2009). To these costs, must be added certification costs. On the other hand, product standards can reduce the exporter's information costs if they convey information on industrial requirements or consumer tastes in the importing country. Portugal-Perez et al. show that internationally-harmonized standards are associated with expanded EU imports of electronics while European standards not harmonized are associated with a lower effect on imports, in some cases a negative effect. Taken together, the results suggest that harmonization of standards increases welfare.

Box 5**The Capture of Rules of Origin by Private Interests***

RoO in PTAs have two components: a small set of regime-wide and a large set of product-specific rules of origin (over 500 different ones in the EU system), typically defined at the HS-6 level of disaggregation. Together, both rules are intended to insure sufficient transformation. The EU and the US who are the main instigators of PTAs have rules that feature a large list of criteria, including technical requirements such as the “triple transformation” requirement in textiles and apparel, which requires apparel to be woven from originating fabric and yarn. Criteria also include exceptions (making them more stringent) and allowances (making them less stringent). The US relies more heavily on changes of tariff classification, though often in combination with other criteria while the EU relies more heavily on the value content and wholly obtained criteria.

To find out how stringent these rules researchers have constructed ordinal measures of overall restrictiveness to indicate that product-specific rules with a greater number of conditions to be met are more restrictive. Research based on preference uptake under NAFTA and the EU system of preferences have shown that after controlling for the extent of preferences, utilization rates are lower for products with restrictive RoO, that restrictiveness of RoO increase with the preferential margin. Detailed analysis of Mexican exports of clothing to the US at the HS-8 level shows that 1/3 of the price rise from sales to the US under preferential access goes to compensate for higher intermediate costs and the price of intermediates sold by the US to Mexico rose under NAFTA. In North-South PTAs, the Southern partner in effect has to buy inefficient goods from the Northern partner to “pay for” preferential access. In sum, the restrictiveness of RoO has been found to go beyond the levels that would be justified to prevent trade deflection suggesting a capture by special interest groups.

Simplification of RoO accompanied by harmonization across PTAs (via the multilateralization of the rules) would represent a significant step towards reducing an actionable NTM. For example, LDCs could be exempted from having to prove origin when preferential margins are less than 3-5%, and single change of tariff classification, or a uniform value content rule could be adopted. In addition to reducing compliance costs, such simplification cum uniformization would reduce administrative costs and free customs officials (according to surveys, customs officials estimate they spend close to 1/3 of their time on checking compliance with origin requirements) for other tasks such as trade facilitation.

Following the Hong-Kong Ministerial declaration stating that developed countries should “...ensure that preferential rules of origin applicable to imports from LDCs should be transparent and simple, and contributing to facilitating market access (paragraph (b) in annex F of the declaration), LDCs have circulated a paper (TN/CTD/”/30) suggesting a combination of value addition and local content criteria. This is clearly an area in which LDCs could press harder for a simplification.

* Cadot et al. eds (2006) and Cadot and de Melo (2008) summarize the literature.

Finally, consider Rules of origin (RoO), necessary to prevent trade-deflection in FTAs, i.e. to prevent imports from entering the zone via the country with the lowest tariff. Even though FTAs are discriminatory in intent, RoO have the legitimate objective of preventing the unwanted extension of preferences to out-of-bloc producers which would erode the value of those preferences to eligible producers (in North-South FTAs, RoO are also sometimes justified on “developmental” grounds as they can help foster the emergence of integrated manufacturing activities in Southern partners).

RoO are notified to the WTO and figure in the NAMA-based WTO inventory of NTMs measures as item F in Part II (Customs and Administrative Entry Procedures). Detailed inventories of RoO used by the EU and US indicate several hundred different RoO defined at the HS-6 level. In North-South FTAs, RoO technical requirements (e.g. the double transformation requirement in the production of clothing) coupled with the regional value content criterion have to be met to qualify for preferential access in the Northern partner’s market. The Southern producers are then forced to source relatively inefficient intermediate goods locally or in Northern partners (compared to most price-competitive sources in, say, Asia).

Digging into the maze indicates that RoO are more restrictive for products with high preference margins. The RoO also end up reducing the value of preferences (compounding preference erosion in particular for Least Developed Countries). Thus, by design via the bargaining and lobbying power of the Northern firms, RoO have been captured by producers and end up as a way to “export protection” (see box 5 for details). Clearly, RoO are an NTM whose initial intent was not protection, but which have been captured by protectionist groups and an actionable NTB (see box 5 for measures that would reduce these costs).

5. Approaches to Eliminating NTMs

Given the difficulty at classifying NTMs, a practical approach is to follow the World Bank (2008a) and use the four principles required of NTMs by the WTO (i.e. transparency, non discrimination, existence of a scientific basis in the case of SPS measures and absence of better alternatives).⁸ This is the approach used in the classification of table 2 which describes the main characteristics of WTO-verified NTMs. Actually, following the ASEAN analysis, we examine in table 2 every identified non-tariff measure

⁸ This is the approach used by ASEAN in their approach at removing NTMs. Using the WTO classification also makes sense if one is looking into the future of the WTS which is more likely to be concerned with marginal adaptation of existing rules than creating or changing drastically existing rules.

in light of the four WTO criteria above and propose, when available, the ad-valorem tariff equivalent as estimated in Carrère and De Melo (2009). The last column also suggests measures that should be replaced by transparent and non-discriminatory measures which nevertheless achieve the same policy goals.

The difficulty is that in a number of cases an NTM can be WTO-compatible but also discriminatory or it may create an obstacle to trade due to its implementation. This why the new UNCTAD/WTO (ITC) classification also introduces the concept of “procedural obstacles” which refers to issues related to the process of application of an NTM, rather than to the measure itself (see box 2). It was decided that information on problems or other excessive burdens related to implementation of NTMs were to be collected through survey data under the broad term of procedural obstacles (see section 2). But for the moment, such information is not available on a cross-section basis and thus we continue to refer to the best criteria currently available, i.e the WTO-compatibility criterion.

As shown in Carrère and De Melo (2009) where a tally is taken of the frequency of the main NTMs from the UNCTAD TRAINS data base, technical regulations (often in the form of SPS measures) is the most frequently used NTM (probably followed by RoO if only because of the growing number of PTAs around the world).

In table 2, the most difficult NTMs to characterize are the technical regulations relating to sanitary measures (for the protection of human beings and animals) and the phytosanitary measures (for the protection of plant health). To be WTO-compatible, SPS measures should be harmonized to the standards guidelines and recommendations of the ‘three sisters’ (CODEX, IOE, IPPC) with LDCs having S&D treatment. The difficulties involved with SPS are evident from the relatively large number of complaints related to the DSU.⁹

⁹ As of December 2008, 35 violations to the SPS agreement had been reported with 10 panels set up to examine 11 complaints, but few developing countries have figured as either complainants or respondents in the disputes reaching the panel stage.

Table 2. A Classification of NTMs

Type of NTM	Objective	Potential for non transparent and discriminatory application	Scientific basis	Tariff AVE ^{a)}	possible levels of negoc. ^{b)}	Alternative measure that can achieve objective in less distortive manner
1400 – Tariff quota duties	Protection	None since based on predetermined criteria such as product type and amount but discriminates between products	None		National(N) Regional(R) Multilateral(M) N/R	Tariffs
2200 – Additional charges	Revenue	None since transparent and applied uniformly on imports	None		N/R	Uniform tax on both domestic and imported products
2300 – Internal taxes and charges levied on imports	Revenue or to cover administrative costs	None since transparent and applied uniformly on imports	None		N/R	Uniform tax on both domestic and imported products
3100 – Administrative pricing	Protection through price control	Non-transparent basis for price; discriminates between products	None	36.7%	N	Tariffs
3400 – Antidumping measures	Protection through price control	None since transparent, covered by WTO Agreement	None		N/R	Remedy already provided for under WTO rules
4300 – Restrictive official foreign exchange allocation	Control outflow of foreign exchange	Transparent but may discriminate between importers	None		N	Uniform surcharge on imports, or tax on all foreign exchange transactions or some otherform of capital control
5100 – Automatic licensing	Monitor imports	None since freely granted	None		N	Ex-post reporting of imports based on customs entries
6100 – Non-automatic licensing	Protection through quantity control	Can be nontransparent, unpredictable, arbitrary, discriminatory	None	38.1%	N	Tariffs
6200 – Quotas	Protection through quantity control	Basis for quota may be non-transparent; discriminates between products	None	42.6%	N	Tariffs
6300 – Prohibitions	Protection through quantity control; also for public health and safety, security, environmental, religious, moral reasons	Transparent but discriminates between products	Covers sensitive products, to protect health, safety, morals, security, environment	46.4%	N/R/M	First establish that prohibition is not related to an SPS measure; Tariffs if rationale is protection; domestic tax or regulation of consumption regardless of source if for technical reasons

Table 2 (continued). A Classification of NTMs

Type of NTM	Objective	Potential for non transparent and discriminatory application	Scientific basis	Tariff AVE ^{a)}	possible levels of negoc. ^{b)}	Alternative measure that can achieve objective in less distortive manner
6700 – Enterprise-specific restrictions	Selective protection	Procedures and their application can be non-transparent and discriminate between products	None		N/R	Tariffs; fiscal incentives given to selected sectors
7100 – Single channel for imports	Fiscal, economic, or social	Transparent but discriminates between products	None	39.8%	N	Tax if fiscal; incentives if economic; tax or controls on domestic consumption, or operation of buffer stock if social
8100 – Technical regulations	Protect health, safety, environment, security	Transparent administration and equal application on domestic and imported products is likely; however, discriminates against subjected products	Yes for health, safety, environment or security reasons	43.3%	N/R	At national level, comply with standards in CODEX, IPPC and IOE; at regional level; harmonization and mutual recognition of standards as in the EU and to a lesser extent the ASEAN
8200 – Pre-shipment inspection	Protect government revenue	Basis for quality, quantity or price evaluation can be non-transparent; discriminates between products and origins unless comprehensive	None		N	Risk management at Customs with post-entry audit
Customs and Administrative procedures (Rules of Origin)	Prevent transshipment	Usually multiple and Complex, but non-discriminatory	Ambiguous		N/R/M	Simplify multiple PSRO and use a uniform criterion across broad category of sectors

a) estimates obtained from the companion paper Carrère and De Melo (2009)

b) Classification by the authors

Next, whether NTMs are to be dealt with at the national, regional, or multilateral level, a sensible approach would be to classify them further as:

- NTMs unnecessary (such as automatic licensing)
- NTMs potentially non transparent and discriminatory (RoO)
- NTMs that are transparent but discriminatory (selected technical regulations)
- NTMs that are transparent and apply to both domestic and imported goods could be retained (unless they are welfare-reducing).

Based on this classification, elimination could then proceed in the order classified above, starting with automatic licensing and other unnecessary NTMs, then proceeding with the others.

Two approaches at eliminating NTMS have been/can be pursued:

(i) The vertical approach which would identify the NTMs measures which are most welfare-reducing. This is for instance the strategy proposed in World Bank (2008b) for the EAC. NTMs are identified in function of how much they restrain Intra-EAC trade and of their political economic complexity. Hence, as reported in figure 2, 4 quadrants are defined (from A to D).

Figure 2:

Categorization of NTMs in EAC: a ranking by the ease of action for removal

Source: World Bank 2008b, figure 3.1 page 16

Given capacity constraints in the regional economic community and its member governments, EAC wants to first target action on these first quadrant (A and B) reflecting NTMs that are both relatively noncontroversial for EAC-wide consensus building for removal and have a negative impact on trade (see the World Bank report on EAC, 2008b, pages 15-16). The intra-EAC trade would benefit more from EAC's

prioritizing those NTMs located in quadrant B during the preparation of action plans for implementation of reduction/removal.

(ii) the horizontal approach which identifies priority sectors and then eliminates NTMs plaguing these sectors;. The ASEAN approach at eliminating NTMs chose the horizontal approach, identifying 11 priority sectors (see box 6) and classifying the NTMs into Red, Amber and Green boxes according to their restrictiveness, regulatory objectives and WTO consistency - see the discussion on the criteria for identifying priority sectors in World Bank (2008a, p. 24-6).¹⁰

Box 6

Priority Sector Criterion*

In 2004, ASEAN singled out eleven sectors as priority integration sectors (independent of the NTM process), based on their great potential for: (a) combining the economic strengths of ASEAN members for regional advantage, (b) facilitating and promoting intra-ASEAN investments, (c) attracting and retaining manufacturing and other activities within the region, (d) promoting outsourcing within ASEAN, (e) developing “made in ASEAN” products and services.” These priority sectors include nine goods sectors (agro-based products, fisheries, healthcare, rubber, wood, textiles, information technology, electronics, and automotive) and two service sectors (air-transport and tourism).

The ASEAN Secretariat identified that reducing the incidence of NTMs in these critical sectors is important for the development of these sectors. This is particularly relevant since an analysis by the ASEAN Secretariat (ASEAN Program for Regional Integration Support, 2005) shows that more often than not, the products with high NTM incidence fall under one of the eleven priority sectors: NTMs seem to be particularly prevalent in electrical equipment, organic chemicals, motor vehicles, tobacco, cereals, sugar, cosmetics, beverages, cereal/flour/milk preparations, edible fruit and nuts, pharmaceuticals, cocoa, dairy products, coffee/tea/spices, live animals, vegetables, meat/fish preparations, vegetable preparations, waste from the food industry, seeds, live trees, meat and edible offal.

* extract from the World Bank report, 2008a, page 24

¹⁰ Based on the combined insights regarding sectoral importance, trade restrictiveness, regulatory objectives and WTO consistency of a given measure, ASEAN has proposed to subsequently classify NTMs into the following categories:

- a) Red Box: NTMs maintained on products traded in ASEAN which would require immediate elimination;
- b) Amber Box: NTMs which could not be clearly identified or classified as barriers; and
- c) Green Box: NTMs which could be justified and should be maintained.

Either approach may be adopted but the examples in section 3 show that it is difficult to estimate the welfare effects of NTMs which is necessary whether a horizontal or vertical strategy at NTM is pursued.

Elimination of NTMs can be pursued: (i) at the national level; (ii) at the regional level in the context of an Regional Integration Agreement in which the country participates; (iii) Multilateral, as in e.g. the Trade Facilitation negotiations at the WTO.

(i) National. When pursued at the national level, there is no concern about delegation of authority to a supra-national level. Since today the vast majority of DCs and LDCs are involved in multiple reciprocal PTAs, the goal should be harmonization and recognition at the regional level so that the RIA is 'deep' and hence welfare-enhancing for all members.

Mexico presents an interesting national program of NTM elimination. As described by Cadot (2009), the Mexican experience highlights the benefits that come from the streamlining of NTMs when it is part of a broader regulatory-reform agenda. The number of licenses, permits and other information requirements in the commerce and transport sectors, for instance, was cut from about one thousand in 1995 to fewer than 400 in 2000 and the Economic Deregulation Unit (UDE), created as early as 1989, reviewed over 500 regulatory proposals between 1995 and 2000. All in all, about 90% of Mexico's regulatory framework was affected by the process.

Box 7

A roadmap for NTM streamlining based on the Mexican experience*

The review of the Mexican experience suggests that the NTM/regulatory improvement toolbox has essentially four elements, each of which can play a role separately or in combination with the others:

1. A consistent and mutually-reinforcing reform agenda, and a strong and permanent *political anchor*, such as a binding trade agreement (like NAFTA)
2. *International support* in the form of technical assistance to the regulatory-improvement body, and international (typically regional) cooperation in the elimination of NTM;
3. A credible *institutional setup* revolving around a strong oversight body with independence, competence, and high-level political support.
4. Engagement of national administrations, in particular middle-level civil servants, in a Regulatory Impact Assessments process for new regulations and NTMs, taken seriously and used in conjunction with systematic exposure and consultation with stakeholders;

* extract from Cadot, 2009, page 9

(ii) Regional. To be successful, NTM removal at the regional level requires some delegation of authority to the supra-national level. The case of the EU summarized in box 8 is the example of the deepest form of NTM removal among sovereign States. However, other efforts have met with some degree of success.

Some examples in developing countries

APEC adopted a Trade Facilitation Plan in 1995 aiming to reduce transaction costs for businesses by 5% by 2006. As detailed in World Bank (2008a), the **ASEAN** has implemented a coherent strategy for overcoming NTMs. Even if the elimination of NTMs has been moving more slowly than tariff reduction (partly due to difficult measurement issues), the ASEAN roadmap for integration specifies that NTMs are to be eliminated by 2010 for the ASEAN6, and 2018 for Cambodia, Laos, Myanmar and Vietnam. It is also noteworthy that **AFTA** which includes ASEAN members has adopted the simplest origin requirement to meet origin (40 regional value content or wholly obtained) for all products, which is significantly less restrictive than the more complex system of RoO adopted by virtually all other PTAs.¹¹

Several ASEAN regional initiatives have been already eliminated some NTMs through the implementation, for instance, of the new ASEAN harmonized tariff nomenclature at the customs level in 2002, the full harmonization to international standards for some TBT dealing with consumer health and safety for 20 priority products in 2003, and for some standards with respect to electrical safety aspects in 2004. ASEAN has also followed the horizontal approach described above.¹²

Another noteworthy regional initiative is the one of the **EAC**, already described above. EAC wants to consider the elimination of NTMs within the context of its evolving common trade policy (see World Bank 2008b).¹³

Why a regional approach to the elimination of NTMs ?

Two main reasons to pursue a regional approach emerge from the regional and country experiences previously discussed:

- Some NTMs on intra-regional trade can be eliminated. These include: (i) border checks and other customs formalities on regional goods; (ii) harmonized legislation on health, safety or environmental protection. Examples of elimination of this kind of

¹¹ See Cadot et al. (2007).

¹² See details on the ASEAN website and in the ASEAN program for Regional Integration Support (2005).

¹³ discussion by the EAC Council of Ministers on the EAC-wide NTMs and course of action to be pursued in analyzing and reducing /removing them is summarized in the EAC Trade Committee Report (February 2008).

NTMs can be found in the EU case (see box 8), the ASEAN case (with for instance the Agreement on Mutual Recognition Arrangements – MRA - intended as “agreements between two or more parties to mutually recognize or accept some or all aspects of one another’s conformity assessment results”), or again the EAC case discussed above.

- Some NTMs on multilateral trade can be alleviated thanks to a supra-national delegation of authority. This is obvious through for instance the Single Action Plan of the EU on Public-Sector purchases of non-domestic origin; or the AFTA initiative to adopt the simplest origin requirement to meet origin, or the ASEAN harmonization to international standards for some TBTs dealing with consumer health and safety; Or the EAC that wants to consider the elimination of the NTMs within the context of its evolving common trade policy. This advantage of “external or supra-national commitment” is also clearly significant in the Mexican case where NAFTA provided a strong impetus for NTM streamlining in Mexico by providing a political anchor to the domestic reform agenda (see Cadot 2009).

(iii) Multilateral. Little progress has been made so far under the Doha Round except for Trade Facilitation. Making trade easier or “Trade Facilitation” (TF) as it has come to be called is an integral part of reforms aimed at reducing trade costs (simplification of trade procedures, harmonization of commercial rules and transparent information and procedures as well as the recourse to new technologies allowing trade promotion and more secure means of payment). Indeed, negotiations on Trade Facilitation are the only item among the Singapore to have been included in the “July package” of 2004 and to attract relative consensus across countries. This consensus is explainable by the sharp rise in intra-industry trade, the rising exchange of intermediate goods, and the verticalization of production in the supply chains that has accompanied the delocalization of activities from developed to developing. The TF negotiations which are to deal with articles V (‘transit freedom’ which is extremely important for LDCs, 16 of the 50 being landlocked), VIII (‘fees and formalities Related to the Import and export’, i.e. red-tape) and X (‘publication and application of rules related to international trade’). A second reason for the consensus in carrying out TF negotiations is that the elimination of the red-tape creates relatively few rents and these measures are not easily subject to capture by officials. In spite of significant fixed costs for LDCs (which could be borne by technical assistance), it is expected that significant market access and increased competitiveness will be achieved by the TF negotiations.

Box 8**The Elimination of NTMs in the EU**

The single market of the EU is the most comprehensive example of economic integration and elimination of NTBs based on the three principles of (i) non-discrimination; (ii) mutual recognition; (iii) Community legislation to ensure the functioning of the common market. The so-called four ‘freedoms’ that cover the movement for goods, persons, services and capital is the result of the abolition of customs duties, QRs, and measures having equivalent effect to customs duties and QRs. Measures *having equivalent effect* have been defined by the European Court of Justice as “All trading rules enacted by Member States which are capable of hindering, directly or indirectly, actually or potentially, intra-Community trade are considered as having an effect equivalent to QRs.” Some sixteen measures have been identified as having equivalent effects. The EC also prohibits all types of trade remedies which include Anti-dumping, safeguards and countervailing measures. In addition, under Mutual Recognition, a Member State may not prohibit the sale of goods lawfully produced in another Member State (the 1979 Cassis de Dijon Case). New law (harmonized legislation) was adopted when existing rules (mostly on health, safety or environmental protection) differed too much across Members and starting in 1985 physical barriers (border checks and customs formalities) were eliminated.

In spite of substantial supra-national delegation of authority to the European Commission, progress in some areas having equivalent effects like public sector purchases of non-domestic origin were slow, so the Single Action Plan was adopted in 1997 to speed up the necessary integration of the Single Market with a scoreboard of implementation put in place. The Action Plan also dealt with formal infringement procedures. If the country fails to comply after the procedure, the European Court of Justice has the power to impose penalty payments and take away privileges under the trader from the country as a last resort

6. Conclusions

Estimates of trade costs are high so the issue is to detect where these trade costs come from. The literature has shown that trade flows are sensitive to both NTMs and BTB measures, some estimates suggesting that BTB measures are higher than NTM measures. Much progress is forthcoming on selected BTB measure via initiatives on Trade Facilitation at the multilateral level. This paper concentrates on NTMs: detecting their effects, and finding out if the reduction in trade flows is welfare reducing.

With the elimination of the bulk of QRs, VERs and other 'traditional' welfare-reducing NTMs, the remaining NTMs are technical barriers to trade. Examples in the paper show that it is difficult to detect when these regulations are 'actionable', i.e. welfare reducing because their intent is not easy to detect. This is particularly the case for SPS measures for which it is difficult to ascertain if they have protectionist intent. In the case of Rules of Origin which have the legitimate objective of preventing trade deflection, in practice, they have been captured by protectionist interest groups and are more clearly actionable.

Proceeding forward requires first a classification of NTMs as to their usefulness regardless of intent (for example automatic licensing can be removed) then figuring out if they are discriminatory against imports or have a welfare cost in which case they should be removed. Some countries have used a vertical approach (identifying priority sectors as in ASEAN) and others a horizontal (eliminating NTMs in sectors where consensus will be easiest to achieve as in the EAC) approach. As discussed in the text, each has its advantage and the appropriateness depends on circumstances. The sequencing of removal has varied across countries and depends on the context.

Another dimension is whether removal is best pursued nationally, regionally or multilaterally. Here too, there are differences in experience across countries and regions. Some NTMs can be removed unilaterally but, given that most countries are engaged in RIAs, a regional approach would be preferable since it brings into focus the gains from harmonization across countries. Multilateral approaches are also desirable but more difficult to achieve because countries are hesitant to give up the necessary sovereignty to move forward.

Annex1

Data Bases on NTMs and Trade Facilitation

This annex describes the main data bases on NTMS and trade facilitation available. Table A1.1 describes the agency responsible for each data base, what is in the data base, the URL to access the data base (when it exists) and the e-mail address for inquiries.¹⁴ Follow some comments on these databases.

We describe first two data bases dealing with estimates of the combination of all NTMs. This is followed by a brief description of the main NTM-specific databases.¹⁵

UNCTAD TRAINS – WITS. The main international datasets on NTMs can be found in the UNCTAD TRAINS data base (through the WITS software). The WITS includes frequency data (i.e. it indicates whether a country has a particular NTM at the Harmonized System 6-digit (HS-6) classification level. These NTMs (often referred to as “core” NTMs are described in table A1.2. This classification corresponds to UNCTAD’s Coding System of Trade Control Measures). Exact information included in WITS is reported in table A1.3. It is this data base that has been used to compute “frequency ratios” or “trade coverage ratios” of NTMs across countries and products (see for instance Bora, Kuwahara and Laird, 2002).

WITS covers theoretically 165 countries (counting European Union as one country) with time span from 1988 to present. However, there are a lot of missing values. In fact, NTM data are actually available for around 100 countries, and not always for recent years. A further difficulty is interpreting the cells with a zero since it may not necessarily reflect the absence of an NTM for the corresponding country/product, but rather missing data. When using WITS data, if possible, one should complement this with data from other sources (as in e.g. Kee et al., 2009, who complete WITS data with information provided by the WTO’s trade policy review and by the EU standard’s database).

¹⁴ This table is taken from the more exhaustive description distributed at a recent two-day meeting “Data Day at the WTO” available at http://www.wto.org/english/res_e/statis_e/data_day_may09_e/brochure_dataday_may09_e.pdf

¹⁵ See the survey in Annex 1 table A1.1. Some of the databases described in this subsection are discussed in more details in a very informative note titled “trade and market access data for policy makers” and available at: http://www.wto.org/english/res_e/statis_e/data_day_may09_e/brochure_dataday_may09_e.pdf

World Bank Overall Trade Restrictiveness Indices. This data base contains several indices computed by Kee et al. (2009). It includes an Overall Trade restrictiveness Index (ORTI) (an aggregate of tariff and non-tariff measures).¹⁶ The data base also includes an estimate of the ad-valorem equivalent (AVE) of “core” NTBs at the country/HS6 product categories level.

Global Antidumping Database This database hosts recently collected publicly and freely available detailed data on twenty-five (as of the completion of version 5.0) different national governments’ use of the antidumping (AD) trade policy instrument, as well as all WTO members’ use of safeguard (SG) measures, China-specific transitional safeguard (CSG) measures, and most of the global users of countervailing duties (CVD) through 2008.

WTO Sanitary and Phytosanitary Measures – Information Management System (SPS-IMS) The SPS-IMS provides access to WTO-related information on food safety and animal and plant health (sanitary and phytosanitary or SPS measures).¹⁷ The system allows users to track and obtain information on SPS measures that Member governments have notified to the WTO, on specific trade concerns raised in the SPS Committee, on documents of the WTO's Sanitary and Phytosanitary Measures Committee, and on Member governments' enquiry points and notification authorities.

EU Standards database The EU Standards Database¹⁸ collates European standards for agricultural products and textiles/clothing over the period 1995-2003, and maps them to the Harmonized System. For each product-year combination, counts are given both of the number of standards and of the number of pages of standards. In general, rapid growth is observed both in the number and average length of standards.

Survey on EU-US NTBs Within the context of the "Study on Non-Tariff Measures to EU-USA Trade and Investment" financed by the European Commission (and ending in 2010), the ECORYS’ team (see details at <http://ntb.ecorys.com/>) will identify the main NTMs (the final report is still forthcoming), based on “a worldwide business survey”.¹⁹ The business survey is used also to estimate the height of the NTMs (i.e.

¹⁶ And freely available at <http://econ.worldbank.org/WBSITE/EXTERNAL/EXTDEC/EXTRESEARCH/o..contentMDK:21085342~pagePK:64214825~piPK:64214943~theSitePK:469382,00.html>

¹⁷ available at <http://spsims.wto.org/>

¹⁸ available at <http://go.worldbank.org/6OEYNCYSD0>

¹⁹ The online business survey was closed by the end of July 2008 with 5.500 responses received. See http://ntm.ecorys.com/index.php?option=com_content&task=view&id=40&Itemid=94. Results not publicly available.

construct NTM indexes at country-pair level). For this reason, the survey is worldwide instead of just EU-US specific. They estimate the height of the NTMs compared to other countries that export to the EU and/or US. Similarly, the business survey collects detailed information on the main barriers to trade, investment and foreign affiliate sales for each sector.

1.2 NTMs in WITS (World Integrated Trade Solution)

The UNCTAD Trains database contains information on non-tariff measures following the categories summarized in table A1.2 (see the detailed UNCTAD Coding System of Trade Control Measures online http://ro.unctad.org/trains_new/tcm.shtm). The UNCTAD-TRAINS website also reports information on which countries have submitted information on NTM (and the latest year for which such data are available (cf. http://ro.unctad.org/trains_new/datacoverage.shtm))

Table A1.2. Non-Tariff Measures in TRAINS

Code	Measure	Example
3	Price Control	minimum import price
4	Finance	Advance payment of customs duties
5	Licensing	Prior surveillance
6	Quantity controls	Seasonal quotas
7	Monopolistic	Sole importing agency
8	Technical	Packaging requirement

Source: WITS summary TDW catalog (2009)

Annex 2.**Annotated Bibliography of recent Papers dealing with the Measurement of NTMs**

[1] Anderson, J. and E. Van Wincoop (2004) "Trade Costs", *Journal of Economic Literature*, 42(3), 691-751.

Subject: Most thorough critical review of the literature on the size of international trade barriers with emphasis on methodological issues and on estimates of the 'border effect'. Heavy emphasis on the benefits and costs of using the gravity model to assess trade costs.

[2] APEC Secretariat (2005) Quantitative Methods for Assessing the Effects of NTM and Trade Facilitation, World Scientific.

Subject: Introduction with collection of essays on NTMs (including in services). Most comprehensive review of different approaches at quantification. Includes several papers listed here (e.g. . Bora, Kuwahara and Laird, 2002, and Deardorff and Stern, 1997) and a short introduction to WITS.

[3] Andriamananjara S., Dean J.M., Feinberg R., Ferrantino M.J., R. Ludema and M. Tsigas (2004, "The effects of Non-Tariff Measures on Prices, Trade and Welfare: CGE Implementation of Policy-Based Price Comparisons", US international trade commission Working Paper #2004-04-A (29 pages)

Subject: Estimates the percentage increase in specific product prices across countries due to NTMs. Uses GTAP simulations. Assesses the trade impact of different type of trade.

Sample: 14 products and 18 countries/regional groups, year 2001.

Data: 2 dummies for NTMs computed from UNCTAD trains data and USITC NTM database, prices data from the EIUS CityData.

[4] Becker G., 2005, "Non-Tariff Measures –Issues for Sub-Saharan Africa", UNDP report (105 pages).

Subject: A standard discussion of NTMs. Notes that certain NTMs are more important than others for SSA countries (provides a checklist of 43 priorities to consider!). Paper argues that regional integration in SSA could be a way to address NTMs (and also the EPA negotiations). No evidence to support the arguments in the paper.

[5] Beghin J.C. and J.C. Bureau, 2001, "Quantification of Sanitary, Phytosanitary and Technical Barriers to trade for Trade Policy Analysis",

Center for Agricultural and Rural Development Working Paper WP291 (35 pages).

Subject: exhaustive survey of literature that models and quantifies NTBs to trade in the agricultural and food sectors (price-wedge method, inventory-based approaches, survey-based approaches, gravity-based approaches, risk-assessment-based cost-benefit measures, stylized microeconomic approaches, quantification using sectoral or multi-market models)

[6] B. Bora, A. Kuwahara and S. Laird, 2002, "Quantification of non-tariff measures", UNCTAD Policy issues series #18 (42 pages)

Subject: Comprehensive review of various approaches to measure and quantify NTMs within the context of existing data sets. It covers much of the same ground as Deardorff and Stern (1997). Has a clear presentation of the pros and cons of different approaches.

The paper applies the same methods as in other reports (i.e. inventory approach, tariff equivalent, TRI, etc.). The only tables reported are NTB coverage for selected countries and some frequency statistics of NTBs. The paper comes up with the same conclusion: "the existing collection on NTBs, while better than nothing, needs to be improved".

Part II, gives good and exhaustive description of available data on NTMs in WITS (products and countries coverage). Analysis is only in terms of frequency (the only analysis possible from WITS database).

Sample: countries available in WITS, latest available year.

Data: from WITS.

[7] A.V. Deardorff and R. Stern, 1997, "Measurement of Non-Tariff Barriers", OECD Working Papers #179 (117 pages)

Subject: Thorough analytical framework that shows that one cannot satisfactorily isolate the effects of an NTB since the outcome of an NTB reflects the measure itself and any other changes, e.g. supply response.

Assesses the different methods for quantifying NTBs. Subsequent papers are often very similar in methodology and classification to this paper.

Classification of NTBs (The 5 broad categories of UNCTAD) : (1) quantitative restrictions and similar specific limitations; (2) non-tariff charges and related policies affecting imports; (3) government participation in trade, restrictive practices and more general government policies; (4) customs procedures and administrative practices and (5) technical barriers to trade (see their appendix 1).

Reviews different measurement methods (with some descriptive statistics):

The presence or size of NTBs (Frequency-type measures, price-comparison measures, quantity–impact measures as well as some NTB-specific methods)

The Effects of NTBs (effective rates of protection, effective rate of assistance, trade restrictiveness index, applied general equilibrium model measures).

Sample: Case studies in the OECD pilot group. Selected countries for the OECD Pilot Group: Australia, Canada, Germany, Norway, United Kingdom/EU, US.

Data: from UNCTAD database and diverse case studies on NTBs done in 1995

[8] W.A. Donnelly and D. Manifold, 2005 “A compilation of Reported Non-Tariff Measures : Description of the information”, US international trade commission Working Paper #2005-05-A (18 pages)

Subject: This compilation provides information on the following 15 NTMs for goods and services

Table 2 - NTM categories used in this compilation

anticompetitive practices / competition policy	intellectual property rights
corruption	investment-related measures
customs procedures	sanitary and phytosanitary measures
export-related measures	services
government procurement	standards, testing, certification and labeling
import licensing	state-trading
import prohibitions	taxes
import quotas	

Sample: 53 countries (table 1 page 3) with a focus on members of the APEC and FTAA.

Data: 3 sources of information:

- 1) the Office of the United States Trade Representative’s (USTR) National Trade Estimate Report on Foreign Trade Barriers (NTE);²⁰
- 2) the European Union’s (EU) Market Access Database;²¹
- 3) the World Trade Organization’s (WTO) Trade Policy Reviews.²²

Framework: Quantitative description from their matrix of data: number of each type of NTM per countries, or of each type of generic barriers by each category of NTM, number of NTM by sector and product, etc.

[9] B. Hoekman and A. Nicita, 2008, “Trade policy, trade costs, and developing country trade”, World Bank Policy Research WP #4797 (29 pages).

Subject: Thorough and most comprehensive aggregate measure of aggregate effects of NTMs on the volume of bilateral trade. Uses a gravity equation to assess the trade impact of different type of trade restrictions

²⁰

http://www.ustr.gov/Document_Library/Reports_Publications/2002/2002_NTE_Report/Section_Index.html

²¹ <http://mkacddb.eu.int/mkacddb2/indexPubli.htm>

²² http://www.wto.org/english/tratop_e/tpr_e/tpr_e.htm

applied at the border. Use of several indexes of trade restriction ,i.e. the TRI of Kee, Nicita and Olarreaga (2008) and the overall trade restrictiveness index (OTRI) used by the WB and the IMF (2008), the latter including both the effect of tariffs and NTMs. It is clearly superior to the more commonly used indicators such as NTM frequency and coverage ratios since it takes into account the elasticity of import demand with respect to prices.

In addition to the OTRI (that captures only a subset of the policies that result in impediments to trade), NTMs are proxied by (1) Logistic performance index LP from the WB (2) the trade facilitation index from the IMD's World Competitiveness yearbook 2000 and others (3) the "Doing Business" cost of trading from Djankov, Freund and Cong 2006. All these indicators are included in a cross section gravity equation estimated using the PPML estimator.

Sample: 104 importers and 115 exporters, year 2006.

Data: See above

[10] L.A. Linkins and H.M. Arce, 1994 revised in 2002, "Estimating Tariff-Equivalents on Non-Tariff Barriers", US international trade commission Working Paper #1994-06-A(r) (23 pages)

Subject: Reviews the measurement of NTBs with a specific focus on commonly used methods for measuring tariff equivalents (Frequency measures, restrictiveness of quantitative restraints, estimation of tariff or export tax equivalents, etc.). Provide a comparison of the Canadian and US applications. Same approach and classification as in [2]

Classification of NTBs = still the 5 broad categories of UNCTAD.

Sample: Canada and US.

Data: from Canada's department of finance (1988) and US international trade commission (1991).

[11] World Bank (2008a), "A Survey of Non-Tariff Measures in the East Asia and Pacific Region", Policy Research Report

Subject: Up-to-date review of the literature on NTM measurement along the lines in Bora et al. (2002) and Deardorff and Stern (1997) recognizing that their effects cannot be measured satisfactorily, nor can they be ranked, justifying a case study approach. Good discussion of the avenues to reduce NTMs at the multilateral (WTO) and at the regional levels and of the experience of the EU, NAFTA, and ASEAN.

Sample: 10 Country Studies bases on survey of exporters. Concludes that compliance costs vary across three dimensions: (i) exporters for given NTMs; (ii) across product categories i.e. agriculture vs. manufactures; (iii) and across destinations i.e. the EU and US vs. a developing country like China.
