

This PDF is a selection from an out-of-print volume from the National Bureau of Economic Research

Volume Title: Income from Independent Professional Practice

Volume Author/Editor: Friedman, Milton and Simon Kuznets

Volume Publisher: NBER

Volume ISBN: 0-87014-044-2

Volume URL: <http://www.nber.org/books/frie54-1>

Publication Date: 1954

Chapter Title: Appendix B: Supplementary Material

Chapter Author: Milton Friedman, Simon Kuznets

Chapter URL: <http://www.nber.org/chapters/c2334>

Chapter pages in book: (p. 489 - 570)

## APPENDIX B

# Supplementary Material

### EXPLANATORY NOTE

This appendix supplements the text tables by presenting in detail the data on which many of the tables are based. It includes three kinds of data: (1) Frequency or percentage distributions of income by size for all professions by region and by size of community; for physicians by type of practice; for lawyers, accountants, and engineers, by organization of practice. Distributions are presented for each year covered by each sample, with two important exceptions: (a) the distributions for the 1937 medical and accountancy samples are for 1934-36 only; (b) none are presented for the 1937 legal sample. (See Ch. 4, footnote 8, for explanation of these omissions.) (2) Measures computed from the distributions: quartiles, median, interquartile difference, standard deviation, relative interquartile difference, and coefficient of variation. For the 1933 medical and dental samples some of these measures are not entirely consistent with other data for these samples. After the distributions had been computed, several errors were found in the original returns. The arithmetic means and all measures for the United States are corrected for these errors; but the other measures computed from the distributions are not. These corrections are the 'final revisions' referred to in the footnotes to the tables. (3) Final estimates of arithmetic mean income by region and by size of community for all professions; and arithmetic mean income by region and by size of community for physicians and lawyers, for all the years covered by the 1937 samples. These final estimates were computed by combining the different samples for the same profession. The text tables give only the averages over the period covered by all the samples; this appendix, the averages for individual years.

Because of biases discussed in Chapter 2 and Appendix A (overrepresentation of firm members in the legal and accountancy samples, size of community bias in the legal samples, and the non-randomness among the states in the 1937 medical sample), it was necessary to weight the returns before computing frequency distributions. For these samples, the measures computed from the

distributions are based on the weighted frequency distributions. Since the latter have no independent meaning, we present instead the percentage distributions computed from them. However, the total number of individuals shown on the tables is the actual number before any weighting or adjusting. Applying the percentages to these numbers will give neither the weighted frequency distributions nor the actual number of returns in each class. Since the data for individual certified public accountants did not have to be adjusted for any biases, the part of Table B 9 c dealing with individual practitioners gives the actual number in each income class.

All samples included some returns on which income was reported for only part of either the first or the last year covered by the return. In the 1933 samples these part-year returns were converted to full-year returns by raising the reported income proportionately, i.e., by dividing the reported income by the fraction of the year it represented. In the 1935 and 1937 samples the part-year returns were treated as such; the arithmetic means were computed by using the actual income reported on a part-year return and counting the return as the fraction of the year it covered. The frequency distributions were computed by placing the return in the class into which it would have fallen had the report been for a full year, but counting the return as the fraction of the year it covered.

The following abbreviations are used in the tables presenting distributions and measures computed from the distributions:

A.M.	arithmetic mean	I.D.	interquartile difference
$Q_3$	third quartile	S.D.	standard deviation
Md	median	R.I.D.	relative interquartile difference
$Q_1$	first quartile	V	coefficient of variation

TABLE B1

Distribution of Income of Physicians by Size and Measures Computed from the Distributions  
a By Region, 1929-1936

W. S. Central	4,428	3,604	3,228	2,519	2,466	2,923	3,260	3,918
Mountain	5,657	4,970	3,906	2,894	2,940	3,657	3,999	4,430
Pacific	5,703	5,360	4,629	3,479	3,224	3,573	3,926	4,365
 <i>SIZE OF COMMUNITY</i>								
500,000 & over	6,175	5,574	4,866	3,654	3,197	3,526	3,548	3,943
100,000 - 500,000	6,374	5,834	5,050	3,791	3,543	4,194	4,507	5,202
50,000 - 100,000	7,269	6,372	5,448	3,958	3,431	3,937	4,017	4,874
25,000 - 50,000	6,373	5,629	4,862	3,631	3,443	3,868	4,301	4,759
10,000 - 25,000	6,030	5,228	4,295	3,385	3,244	3,934	4,238	4,633
2,500 - 10,000	4,721	4,140	3,810	2,897	2,783	3,116	3,505	3,829
Under 2,500	3,368	2,882	2,416	1,791	1,802	2,126	2,260	2,663
U.S.	5,573	4,965	4,300	3,235	2,985	3,431	3,633	4,129

These final estimates were computed from arithmetic means presented in Tables B1a, B1b, and B2. The arithmetic means for 1932 from the 1933, 1935, and 1937 samples were averaged. This average was then extrapolated back to 1929 on the basis of the 1933 sample, forward to 1934 on the basis of the 1935 sample, and from 1934 to 1936 on the basis of the 1937 sample. The averages for the 1937 sample are weighted averages of the state averages.

For footnotes see p. 569.

TABLE B 5

Final Estimates of Arithmetic Mean Income of Dentists<sup>2</sup>, 1929-1934  
By Region and by Size of Community

REGION	1929	1930	1931 (dollars)	1932	1933	1934
New England	4,739	4,609	4,137	3,274	2,914	2,996
Middle Atlantic	6,156	5,708	4,930	3,624	2,992	3,131
E. N. Central	4,468	4,046	3,422	2,542	2,282	2,590
W. N. Central	3,954	3,788	3,122	2,212	1,872	2,108
S. Atlantic	4,729	4,369	3,814	3,090	2,854	3,086
E. S. Central	3,563	3,538	2,753	1,886	1,897	2,201
W. S. Central	4,613	4,176	3,444	2,396	2,332	2,652
Mountain	4,328	4,082	3,764	2,778	2,464	2,788
Pacific	5,033	4,911	4,160	2,967	2,625	2,876
<i>SIZE OF COMMUNITY</i>						
500,000 & over	5,800	5,441	4,640	3,384	2,945	3,151
100,000 - 500,000	5,263	4,900	4,232	3,100	2,632	2,902
50,000 - 100,000	5,011	4,654	4,070	3,092	2,609	2,890
25,000 - 50,000	5,001	4,748	4,065	3,098	2,669	2,905
10,000 - 25,000	4,752	4,510	3,823	2,766	2,495	2,765
2,500 - 10,000	4,043	3,737	3,159	2,394	2,181	2,379
Under 2,500	2,961	2,807	2,350	1,732	1,679	1,954
U.S.	4,768	4,475	3,825	2,824	2,487	2,725

These final estimates were computed from arithmetic means presented in Tables B 4a and B 4b. The arithmetic means for 1932 from the 1933 and 1935 samples were averaged. This average was then extrapolated back to 1929 on the basis of the 1933 sample and forward to 1934 on the basis of the 1935 sample.

For footnotes see p. 569.

S. Atlantic	3,803	2,949	3,376	3,246	4,177
E. S. Central	3,633	3,463	3,694	3,861	3,800
W. S. Central	2,884	2,589	2,904	2,731	3,223
Mountain	3,033	2,384	2,732	2,899	2,882
Pacific	4,488	3,714	3,616	4,062	4,824
<i>SIZE OF COMMUNITY</i>					
1,500,000 & over	7,225	6,215	6,475	6,866	6,766
500,000 - 1,500,000	3,851	2,976	3,297	3,435	5,223
250,000 - 500,000	4,752	4,513	3,688	4,085	4,394
100,000 - 250,000	3,308	3,110	3,842	4,154	4,719
25,000 - 100,000	4,087	3,722	3,797	2,477	3,873
10,000 - 25,000	3,822	3,349	3,978	4,281	4,829
2,500 - 10,000	2,579	2,287	2,545	2,522	2,758
Under 2,500	1,970	1,654	1,852	1,929	1,994

These final estimates were computed from arithmetic means presented in Tables B6a, B6b, and B7. The arithmetic means for 1934 from the 1935 and 1937 samples were averaged. This average was then extrapolated back to 1932 on the basis of the 1935 sample and forward to 1936 on the basis of the 1937 sample. The averages from the 1937 sample are weighted averages of the averages for each state. The averages for the 1935 sample are adjusted for the firmmember bias. Both samples have been adjusted for the size of community bias.

For footnotes see p. 569.

W. S. Central	6,406	5,465	4,890	4,138	3,507	3,780	3,982	4,706
Mountain	5,056	4,736	4,085	3,236	3,231	3,981	4,175	4,415
Pacific	5,579	5,156	4,586	3,545	3,212	3,478	3,532	3,859
 <i>SIZE OF COMMUNITY</i>								
1,500,000 & over	8,837	8,099	6,417	4,778	4,549	4,784	5,180	5,604
500,000 - 1,500,000	6,246	5,984	5,192	4,133	3,785	4,055	4,096	4,483
250,000 - 500,000	7,265	6,985	6,008	4,782	3,894	4,636	4,828	4,079
100,000 - 250,000	7,131	6,118	5,125	4,307	3,869	4,210	4,097	4,704
25,000 - 100,000	5,577	4,962	4,532	3,695	3,523	4,156	4,493	4,861
Under 25,000	4,479	4,208	3,405	2,879	2,775	3,229	3,308	3,772
U.S.	7,149	6,597	5,477	4,309	3,970	4,366	4,578	4,993

These final estimates were computed from arithmetic means presented in Tables B 9a and B 9b. The arithmetic mean for 1934 from the 1937 sample was extrapolated to 1932 on the basis of the 1935 sample. The resultant figure and the arithmetic means for 1932 from the 1935 and 1937 samples were averaged. This average was then extrapolated back to 1929 on the basis of the 1933 sample, forward to 1934 on the basis of the 1935 sample, and from 1934 to 1936 on the basis of the 1937 sample.

For footnotes see p. 569.

AVERAGE COEFFICIENT OF VARIATION

AVERAGE RELATIVE INTERQUARTILE DIFFERENCE

For footnotes see p. 569.

## FOOTNOTES TO APPENDIX B TABLES:

<sup>1</sup> In computing the coefficient of variation, we used the arithmetic mean computed from the frequency distribution (where total income was estimated by multiplying the midpoint of each income class by the frequency in the class and summing over all classes).

<sup>2</sup> Includes some returns for which location of practice is unknown.

<sup>3</sup> Data for dentists have not been adjusted for the restriction of the samples to American Dental Association members.

<sup>4</sup> Before any weighting or adjusting.

<sup>5</sup> The distribution in the negative income classes was obtained by raising the number of known losses by the ratio of total losses to known losses. This was done separately for each region, each size of community class, and the United States. For this reason, the sum of the regions and size of community classes does not equal the number for the United States in the negative income classes.

<sup>6</sup> The frequency distributions for the 1933 medical and dental samples do not incorporate final revision (see Explanatory Note).

<sup>7</sup> Arithmetic means for all regions, all size of community classes, and the United States incorporate final revisions and are, therefore, not based on the number of individuals shown in the table.

<sup>8</sup> Measures for the United States incorporate final revisions.

<sup>9</sup> All data from the 1937 medical sample have been weighted to correct for the nonrandomness of the sample among the states.

<sup>10</sup> The data from the 1935 legal sample have been adjusted for the firm member and size of community biases.

<sup>11</sup> The averages from the 1937 legal sample are weighted averages of the averages for each state, and have been adjusted for the size of community bias.

<sup>12</sup> All data from the accountancy samples are adjusted for the firm member bias.

<sup>13</sup> The average for all samples is a weighted average of the averages for each sample, the weights being the number of years covered by each sample.
