Analysis of Representative Rice Farms Under H.R. 2646 and the Continuation of the FAIR Act

In anticipation of the new farm bill, seventeen representative rice farms from six different rice-producing states have been analyzed to compare the continuation of the FAIR Act provisions with the House proposal, H.R. 2646. Each farm was simulated assuming each policy would be in place for the next five-year period, or 2002-2006. A full description of each of the farms can be found in the Appendix.

FAIR Act

Continuation of the FAIR Act would mean that Agricultural Market Transition Act (AMTA) payments would be made throughout the period at the rate scheduled for 2002. In order to qualify, a producer or owner must have participated in any of the 1991-1995 programs for rice, feed grains, cotton or wheat and agree to implement a Production Flexibility Contract (PFC). In exchange for the payments, the producer or owner must: (1) meet the specified conservation requirements dealing with wetlands and use of erodible land, (2) must only use the contract acreage for agricultural type activities, and (3) must meet the requirements for planting flexibility.

Nonrecourse commodity loans and marketing loans are assumed to continue. A moving average of past market prices would yield the minimum levels for the commodity loans. Marketing loan rates and nonrecourse loans would be available to producers of rice, feed grains, wheat, oilseeds and upland cotton. However, these benefits are only made available to qualified producers if market prices fall below the commodity loan rates. Loan deficiency payments (LDP) are available to those producers who do not choose to take advantage of the CCC loan. Any producer applying for either kind of assistance must be in compliance with the wetlands and conservation requirements.

H.R. 2646

H.R. 2646 would continue to provide the American farmer with the planting flexibility that was given to them with the FAIR Act while providing the benefit of counter-cyclical protection from the effects of adverse market conditions. These counter-cyclical payments (CCP) would be triggered when the crop's price (after being adjusted for the AMTA payment) falls below its target price. The CCP rate would be calculated as the target price minus the decoupled payment rate (AMTA rate) minus the higher of the twelve-month season average price received by the producers or the national average loan rate. The decoupled payments, as well as, marketing loan program benefits would still be available to qualified producers. The marketing loan rates set in the FAIR Act will remain the same with the exception of soybeans and grain sorghum. The rate for soybeans would be reduced to a level that is consistent with all other commodities while grain sorghum would be raised equal to the loan rate for corn.

The proposed program would also offer producers the option to retain their old base acres or update their base according to recent plantings. The updated base option would be an average of 1998-2001 planted acres of each commodity. Farms could acquire soybean base by choosing this option. The fixed de-coupled payments (AMTA) and the counter-cyclical payments would be paid on eighty-five percent of the producers base acreage. However, farm program yields for each producer will not change. AMTA base acreage and farm program yield that is comparable to AMTA yields in the area would be developed for soybeans. The payment limits for this program are set at \$50,000 for fixed decoupled payments, \$75,000 for counter-cyclical payments and \$150,000 for the marketing loan gains and/or loan deficiency payments.

A comparison of the parameters for the FAIR Act and the H.R. 2646 proposal is provided in Table 1 and Figure 1. All loan rates in the proposal except sorghum and the soybeans remain at their levels under the FAIR Act. The sorghum loan rate was raised to the level of corn, and the soybean loan rate was reduced. The proposed target prices for grains and cotton are set at 1995 levels. Soybeans would be assigned a target price of \$5.26/ bu. AMTA rates for rice, cotton, and feed grains would be increased by the proposal over their current levels in the FAIR Act. The reduction in the soybean loan rate is offset by a \$0.42/bu AMTA rate.

Results

The 17 representative rice farms were simulated using AFPC's whole farm simulation model to project the economic impacts under the current program and the H.R. 2646 proposal. The sector level analysis of H.R. 2646 by FAPRI was used as input into the farm level analysis. FAPRI's analysis showed H.R. 2646 would only have minor changes in planted acres (Table 2) and prices for the program crops (Table 3), from their January 2001 baseline for the current farm program as well as modest increases in cost of production. On average over the 2002-2010 time frame, the nine program crop acreage would increase by 810,000 acres. Of this, rice acreage would account for approximately 20,000 acres. Soybean acreage would decrease by 61,000 acres. Due partly to this decrease in acreage, price for soybeans is projected to increase an average of \$0.04. Rice prices, however, are projected to be down an average of \$0.07/cwt. Total government payments to agriculture would increase Commodity Credit Corporation (CCC) net outlays by an average of \$16.0 billion per year under H.R. 2646. FAPRI also reports that 88 percent of the increase in government outlays contributes to the increase in net cash farm income. On average under H.R. 2646, government payments would account for 35 percent of rice gross receipts as compared to the 30 percent under the FAIR Act.

If given the option to update their base acres as in H.R. 2646, 10 out of the 17 rice farms would update base acres to their average planted acres over 1998-2001 (Table 4). The changes in base acres for these farms ranged from 224 acres on TXR3200 to as much as 2,532 acres on MSR4735 (Table 5). The 7 farms that would choose to keep their 1996 base had not increased their acreage over the 1998-2001 years. The 10 operations that would take advantage of the option to update their base have expanded their rice acres since 1985 and/or raise soybeans. It was determined that gains from these sources would offset any losses in income that the 10 farms might incur from giving up base on the other program crops. For example, the Northeast Louisiana farm would lose about 20 cotton base acres but on net would gain base because of increased rice and soybean acreage.

All of the 17 rice farms would experience an increase in average annual net cash farm income over the 2002-2006 period under H.R. 2646 (Table 6). Several of the farms would see their average net cash incomes change from negative to positive if H.R. 2646 was put in place (CAR424, CAR2365, CAR1420, TXR1650, LANR2500, and MSR4735). The California farms would observe more than a \$95 per acre increase in net cash farm income while the other farms gain \$30 to \$50 per acre as a result of the proposed program. The California farms gain more per acre because they only grow rice and their farm program yields for rice are 18.4 cwts. more per acre than the average of the other farms.

When looking at cash reserves, 16 of the farms had greater than a 70 percent chance of a cash flow deficit in 2006 assuming the continuation of the FAIR Act (Tables 7-15). Twelve of the 17 farms have a greater than 90 percent chance of cash flow deficits in all years. Even the three farms with the most favorable net income situation, 3,640 and 5,000-acre Arkansas farms and the 4,000-acre East Missouri farm, are projected to see increasing probabilities of cash flow deficits over the period. The 3,640-acre Arkansas farm begins with only a 7 percent chance of a deficit, but by 2005 its probability increased to 60 percent. The 5,000-acre farm does not fair as well. It begins with a 43 percent probability of a deficit, which steadily increases to 89 percent by 2006. The East Missouri farm has a 58 percent chance of a deficit in 2002, which increases to 90 percent by 2005.

Under the House Bill H.R. 2646, all 17 rice farms increased net cash farm income relative to the current farm bill (Figures 2-18 and Tables 7-15). These increases range from \$43,000 on the 424 acre California farm to \$234,000 on the 2,365-acre California operation. Sixteen of the 17 farms showed a decrease in their probability of cash flow deficit under H.R. 2646 compared to the current farm bill in at least one of the 5 years (Tables 7-15). Only the 2,500-acre North Louisiana farm and the 1,650 acre Texas farm showed no decrease in their probability of a cash flow deficit in any of the years (Tables 10 and 11). However, 3 farms showed an increase in their probability of cash flow deficit for at least one of the years under H.R. 2646 as opposed to the current farm bill. For example, MSR4735 in 2003 under the current farm bill has a 99.0 percent chance of experiencing a cash flow deficit, but in the same year has a 99.8 percent chance under H.R. 2646 (Table 15). Sixteen of the 17 farms also either improved or showed no change in their probability of losing net worth from the current farm bill to H.R. 2646 in all years (Tables 7-15). The TXR1650 farm showed no change in its probabilities from one program to the other with the exception of 2004 where its probability increased from 99.0 to 99.8 percent (Table 10).

The impacts of H.R. 2646 on a farm's net cash farm income can also be determined using probability distributions (Figures 2-18). The s-shaped lines in figures show the range of average annual net cash farm income values from 2002-2006 that could occur for that farm if the particular program was in place. The thin vertical line is both the zero net cash farm income line and the line from which probabilities can be read. The probability of a particular net cash farm income value for a particular program can be found by tracing up from an income value on the bottom axis until it hits the program line of interest and reading across to the probability line. For example, the CAR424 farm has about a 33 percent chance of income less than \$25,000 under the H.R. 2646 proposal (Figure 7).

The net income figures can also be used to determine the probability of the farm meeting its average annual cash need for the 2002-2006 time period under each program. Average annual net cash need is the bold vertical line, which represents average family living expenses, income taxes, social security, principal payments, and machinery replacement. The probability of having a cash flow deficit can be read at the point where the minimum cash needs line crosses a program's net cash income line. If the minimum cash needs line does not cross the program line then there is a 99.9 percent chance that the particular farm would not meet its average cash needs. For example, CAR424 (Figure 2) has a 99.9 percent probability of a cash flow deficit on average over the years 2002-2006 under the FAIR Act because the Fair Act's income line lies to the left of the minimum cash needs line. The probability of a cash flow deficit decreases slightly to roughly 90 percent under H.R. 2646 for the CAR424 farm (Figure 2).

Summary

While the net cash farm income for each farm increases under H.R. 2646, the outlook for many of the representative rice farms remain rather bleak. Many of the farms continue to face significant chances of a cash flow deficit and losing real net worth even with the additional government support that H.R. 2646 would provide.

**Appendix A:
Characteristics of Panel Farms Producing Rice**

CAR424

A 424-acre Sacramento Valley California (Sutter and Yuba Counties) moderate size rice farm that plants 400 acres of rice. The farm generates 97.8 percent of its gross receipts from rice.

CAR2365

A 2,365-acre Sacramento Valley (Sutter and Yuba Counties) large rice farm that plants 2,240 acres of rice and generates 98 percent of its gross receipts from rice.

CAR1000

A 1,000-acre rice farm (Butte County) that harvests 1,000 acres of rice. Rice accounts for 99.5 percent of the farm's gross receipts.

CAR1420

A 1,420-acre rice farm (Colusa County) that harvests 1,420 acres of rice. 99.9 percent of the farm's gross receipts are from rice.

TXR1553

A 1,553-acre Eagle Lake, Texas (Wharton County) moderate rice farm that harvests 450 acres of first crop rice and 405 acres of ratoon rice. This farm generates 97.5 percent of its gross receipts from rice.

TXR3774

A 3,774-acre Eagle Lake, Texas (Wharton County) large rice farm that harvests 1,589 acres of first crop rice and 1,351 acres of ratoon rice. Rice accounts for 98.2 percent of the farm's gross receipts.

TXR3200

A 3,200-acre El Campo, Texas (Wharton County) rice farm that harvests 1,280 acres of first crop rice, 1,024 acres of second crop rice, 160 acres of sorghum and 160 acres of soybeans. Rice accounts for approximately 98.2 percent of the farm's gross receipts.

TXR1650

A 1,650-acre Bay City, Texas (Matagorda County) that harvests 550 acres of first crop rice and 475 acres of ratoon rice.

* Receipts for 2000 are included to indicate the relative importance of each enterprise to the farm. Percents indicate the percentage of the total receipts accounted for by the livestock categories and the crops.

** Acreages for 2000 are included to indicate the relative importance of each enterprise to the farm. Total planted acreage may exceed total cropland available due to double cropping. Percents indicate the percentage of total planted acreage accounted for by the crop.

**Appendix A:
Characteristics of Panel Farms Producing Rice (Continued)**

LANR2500

A 2,500-acre Northeast Louisiana (Richland Parish) rice farm harvesting 1,000 acres of rice with 750 acres of soybeans, 325 acres of cotton, 100 acres of sorghum and 200 acres of corn. Rice generates 63.4 percent of the farm's gross receipts.

LAR1200

A 1,200-acre Southwest Louisiana (Jefferson Davis, Acadia and Vermilion Parishes) moderate size rice farm that harvests 660 acres of rice, 324 acres of soybeans and 210 acres of fallow. This farm generates 85 percent of its gross receipts from rice.

ARR3640

A 3,640-acre Stuttgart, Arkansas (Arkansas County) large rice farm with 122 acres of medium grain rice, 1,620 acres of long grain rice, 883 acres of soybeans, 615 acres of wheat and double-cropped soybeans. About 73.9 percent of this farm's gross receipts are generated by rice.

ARR3000

A 3,000-acre Hoxie, Arkansas (Lawrence County) rice farm that harvests 225 acres of medium grain rice, 1,275 acres of long grain rice, 1,256 acres of irrigated soybeans, 94 acres of dry soybeans and 150 acres of wheat. Rice accounts for about 78 percent of gross receipts.

ARR1200

A 1,200-acre Wynne, Arkansas (Cross County) rice farm that harvests 600 acres of long grain rice, 576 acres of irrigated soybeans, 24 acres of dry soybeans and 60 acres of wheat. Approximately 79.3 percent of gross receipts are accounted for by rice.

ARR5000

A 5,000-acre McGhee, Arkansas (Desha County) large rice farm that harvests 1,500 acres of long grain rice, 1,400 acres of irrigated soybeans, 1,800 acres of irrigated cotton and 300 acres of wheat. Cotton and cottonseed make up 50 percent of this farm's gross receipts while rice accounts for 37.2 percent.

MOWR4000

A 4,000-acre Southeastern Missouri (Butler County) large rice farm with 2,000 acres of rice and 2,000 acres of soybeans. Rice generates 71.1 percent of this farm's gross receipts.

MOER4000

A 4,000-acre Southeastern Missouri (Stoddard County) large rice farm with 1,334 acres of long grain, 1,333 acres of soybeans and 1,333 acres of corn. 50 percent of this farm's gross receipts are generated by corn.

MSR4735

A 4,375-acre Mississippi (Tunica County) rice farm that harvests 1,335 acres of long grain rice, 2,700 acres of soybeans and 500 acres of cotton. Rice generates 55.3 percent of this farm's gross receipts.
