#### INTRODUCTION

Notes and Suggestions for Improvement.....

The Division of Agricultural Economics and the Division of Agricultural Extension of the University of Minnesota, the Bureau of Agricultural Economics of the United States Department of Agriculture, and the farm bureaus of Dodge, Freeborn, Goodhue, Le Sueur, Mower, Rice, Steele, and Waseca Counties organized late in 1927 the Farm Management Service Project, to operate in the above named counties, beginning January 1, 1928. This farm management service is offered to farmers who desire to keep farm records, and to have these records summarized and analyzed in connection with those of other farmers. Each farmer who cooperates in this service pays an annual fee which covers a part of the cost.

The project is under the direction of G. A. Pond and W. P. Ranney of the Division of Agricultural Economics, University of Minnesota. Hearty support

Page

31

### TYPE OF FARMING

The service is restricted to livestock farms on which dairy cattle are the principal source of income. Although some milk and cream are retailed in cities, and some milk is sold for shipment to the Twin Cities, cream for manufacture into butter is the principal dairy product sold. This is marketed through farmer owned cooperative creameries specializing in the manufacture of high quality butter. The skimmilk is retained on the farm and fed to hogs and poultry. These two classes of livestock are also an important source of income.

The principal crops grown are corn, oats, barley, and hay. These crops are raised primarily as livestock feed although a seasonal surplus may be sold. Wheat, sweet corn, canning peas, sugar beets, flax, and potatoes are grown to a limited extent as cash crops. Weather conditions were somewhat more favorable for corn production in 1933 than in previous years, but less favorable for other crops.

This report shows that the receipts from the sales of dairy products constituted one-third, and the receipts from hog sales a little more than onesixth of the average cash income of 108 cooperators included in this report. These farms are fairly typical of the system of dairy farming prevailing in southeastern Minnesota.

## CLIMATE, SOIL, AND TOPOGRAPHY

The weather conditions normally are fairly uniform in these eight counties, but there is some variation in soil conditions and topography. The soil varies from sandy loam to a rich black clay loam; the latter type predominates in this area. Some of the farms are level, all tillable, and well drained, but most of them are gently rolling with some land too rough or too wet to cultivate. Goodhue County has more rolling land than the other counties. Much of the level land is tiled to make possible its cultivation in wet years. However, on a number of farms, there is considerable land which is poorly drained. In Goodhue, Dodge, and Mower Counties, and the eastern part of Rice and Steele Counties, the soil is generally lime deficient, and applications of lime are necessary in order to grow alfalfa and sweet clover. In the remainder of the area, it is not necessary, as a rule, to apply lime in order to grow these two crops.

#### RECORDS KEPT

The records kept by the cooperators included inventories at the beginning and end of the year, cash receipts and expenses, a report of feed fed to the various classes of livestock, and a record of farm produce used by the farm family. Supplementary information was also secured during the year regarding crop and livestock production and practices.

The cooperators were assisted and supervised in keeping their records by the field agent, R. C. Bevan, who visited each farm in the eight counties several times during the year. In addition to securing the supplementary information, the field agent's duties included numerous services, viz., securing a monthly list of prices of farm products prevailing in the areas, helping the farmer place uniform values on real estate and equipment, checking the cash and feed records, and answering any questions that might arise as to how the entries should be made in the account book. The supervision resulted in uniformity in the type of records secured, in the inventory valuations and in the prices at which feed and farm produce were charged.

At the end of the year, each farm was visited by a representative of the University who checked the records for completeness and accuracy. The books were then taken to the central office at University Farm, where every entry was again checked and omissions were noted. Any discrepancies found were referred back to the farmers for correction. This double checking insured a high degree of accuracy and completeness in each individual record.

### PURPOSE OF PROJECT

The Farm Management Service renders assistance to the cooperators in keeping such records as will enable each operator to know the returns for his labor and management, the returns to capital and family labor, and the actual earnings from the farm that the family had to spend for living and personal use. The main purpose of the service is to secure such data and information, which when compared with that secured on other farms, will enable the cooperator to increase his efficiency in various enterprises and to organize his farm on a more profitable basis. For the latter purpose, it was necessary for all the cooperators, tenants as well as owner operators to include the whole farm business in order that the results would be on a comparative basis. For the purpose of comparison, the earnings as shown in this report are computed as if each farm was owned by its operator; however, each tenant is supplied a statement of his earnings on the basis of the rental system under which he was operating.

## ANALYSIS OF THE FARM BUSINESS

On pages 6 and 7 are presented financial summaries of the year's business, showing the average results for the 108 farms on which the work was completed for the twelve months' period, January 1, 1933 to December 31, 1933, and the average results for the highest one-fifth of the farms in respect to Operator's Labor Earnings, and likewise for the lowest one-fifth. In the "your farm" column, in the copy sent to the farmer, the results of his individual farm business are inserted in order that he may compare his figures with the averages of the various groups.

The data on page 9 and the remaining pages, which set up the ranking in the various measures of efficiency, should suggest to each cooperator some possibilities for improvement in his organization of the various enterprises and of the business as a whole. Although each farm is an individual problem and has its particular advantages and limitations, the type of farming is fairly uniform in the area. This study should bring out trends toward more profitable combinations of enterprises, and also toward more efficient methods of management within the enterprises. In spite of the differences in physical and economic conditions explained on page 2, it is significant that the same general factors account for financial success in all of the eight counties.

### CAPITAL INVESTMENT IN FARM BUSINESS

The average size of the farms in this report was 202 acres. The average farm inventory was \$16,522. This does not include the value of the house in which the operator lived. In 1933, 46.9 per cent of the average farm inventory consisted of land; 21.5 per cent of permanent improvement; 8.4 per cent of feeds and supplies; 11.2 per cent of machinery and equipment; and 12.0 per cent of livestock, of which two-fifths or an average of \$787 was the average inventory value of milk cows.

#### RETURNS TO OPERATORS FOR THEIR LABOR AND MANAGEMENT

The average cash receipts per farm were \$2936. In addition, farm produce to the value of \$193 was consumed by the farm family and there was an average inventory increase of \$505 per farm. The total average receipts per farm is the sum of these three items, \$3634. The average total expense per farm, \$1581, includes \$1510 cash expense and an estimated allowance of \$71 for board of hired labor. The difference between the total income and total expense figure is \$2053. This is the return which the farmer received for his own labor and management, the services of members of his family and the use of his capital. After deducting a charge of 5 per cent on the average inventory valuation, \$226, for the services of capital, there remains \$1227 for the services of the farmer and his family. The average value of family labor used, if computed at hired man's wages, was \$241. The average operator's labor earnings is the family earnings less their allowance of \$241, or \$986. This is the return to the farmer for his labor and management over and above a 5 per cent return for his capital and going wages for other members of the family.

On page 21, financial summaries for 1933 are shown for six groups of farms, classified on basis of size (total acres in farm). A comparison of the financial returns and other miscellaneous information for 1928 to 1933 inclusive is given on pages 29 and 30.

The table on page 18 shows the average amounts and values for each item included in the total of farm produce used in the house. On many farms, a saving could be made if more produce were raised on the farm rather than purchased.

Sixty-eight farmers included in this report kept a detailed record of personal and household expenses, and asked for a distribution of these expenses. This distribution is shown on page 18, with averages for the sixty-eight farms and for the fourteen most profitable and fourteen least profitable in this group. Taking into consideration the number of members (adult equivalents) in his family and the number in the average family, each farmer can compare his items of expense with those of the average.

Items	Your farm	Average of 108 farms	22 most profitable farms	22 <b>least</b> profitable farms

(1) Explanation of term: "Days of Productive Work".

The total "Days of Productive Work" for any one farm are a measure of size of that farm business. The average number of "ten-hour days" of man labor required per head of productive livestock and per acre of crops is used in combining the crops and the livestock in one single measure of size of business.

The number of days of productive work for each animal and each acre of crops, computed from data presented in Minnesota Technical Bulletin 44, "A Study of Dairy Farm Organization in Southeastern Minnesota", are listed as follows:

Item		No.of days of prod.work	Item	Per	No.of days of prod.work
Cows	Cow	16.6	down for anoin	Aamo	0.1
Other cattle	Animal unit*	· /	Corn for grain (husked)	Acre	2.1
Sheep	Animal unit*	•	Corn for grain	H	2.8
Poultry	100 hens	20.1	(husk & shred.	)	•
Hogs	100 lbs. por	k .55	Corn for silage	, ц	2.6
	prod.		Corn hogged	. т <b>п</b> .	1.25

### EFFECT OF WELL BALANCED EFFICIENCY ON FARM PROFITS

It is quite evident from this report that few farmers have a monopoly on efficiency. Quite often farm operators show efficient management in one part of the farm business, which is offset by poor results in other phases of the business. These farmers get medium returns while those who fall down all along the line get the lowest returns and those few who can manage a large volume of business with high all around efficiency receive returns well above the average.

The data in this report and the reports of recent years in this same area, indicate that there are many factors of various degrees of importance which show relationships with operator's labor earnings or which offer opportunities for increasing earnings. Size of business tends to be a disadvantage to those who show a loss, for greater size is a factor serving to increase the loss. However, for those who excell in most of the other factors and receive some return for their labor and management, the latter tends to be increased by size of business. Likewise, it is an advantage to have more livestock per hundred acres when the stock shows a profit and a disadvantage when it shows a loss. Hence, a high balanced standing in the following eight factors is quite essential in order to secure the highest possible returns:

- 1. Pounds of butterfat per cow.
- 2. Returns above feed cost for productive livestock (other than cows) per animal unit.
- Productive livestock units per 100 acres.
- 3. Productive ... 4. Crop yields.
- Percentage of tillable acres in high return crops.
   Size of business--days of productive work.
- 7. Days of productive work per worker.
- 8. Equipment and farm power expense (building, fencing, all machinery, horse feed, and miscellaneous horse expense) per day of productive work.

In Chart I is shown the effect of the number of the above factors in which the farmer excels on his labor earnings. The ten farmers who excelled in 7 or 8 factors had earnings of \$1,821 above the average of 2 farmers who did not excell in any of the factors.

	of Fact	tors in wh	nich Farmer is above the Average

Chart I. Relation of Operator's Labor Earnings to the Number

The array in Chart I suggests that it will be worth while for each cooperator to study carefully his ranking on pages 9 and 10, and learn through his standing in respect to each of the above factors the elements of strength and weakness in his farm business.

Viold of Groom 1933

Some methods farmers use to increase their crop yields:

Tile, if necessary. 1.

- 2. Plow under legumes-grow sweet clover in small grains on high lime soil--lime for alfalfa, if necessary.
- Test out commercial fertilizers on strips of land to see 3. if they pay.
- 4 Utilize manure effectively.
- 5. Use rotated legume pastures.
  6. Raise and feed hogs on these pastures and hog down corn.
- 8. Use best tested seed available,
- Prepare seed-bed throughly and timely. 9.

Footnote for pages 29 and 30.

The values of farm real estate in 1931 were reduced approximately 25% from 1928-1930 values. The values in 1932 were reduced about 29% from the 1931 values. Only land was affected by the reduction in 1931, but in 1932 buildings and improvements were cut 25%. The value of dairy cows was also adjusted downward in 1932. These capital losses were not included in the inventory decreases in the financial statement but the decreased valuation resulted in a lower interest charge. No changes in the basis of inventory valuations were made in 1933.

The financial statements differ also in that the unpaid family labor rate was \$60 per month for the 1928 to 1930 period, \$40 in 1931, and \$30 in 1932 and 1933; and the board for hired labor was figured at \$20 per month in 1928, 1929, and 1930, \$15 per month in 1931, and \$10 per month in 1932 and 1933.

These adjustments to meet changes in the price level, should be considered in comparing 1933 results with previous years.

None of the wheat adjustment payments received on account of the A.A.A. program ware included in the farm receipts for 1933. As only part of the farmers had received these payments before December 31, 1933, they were carried over to the 1934 records, in order that the 1933 records would be comparable.

The calculation of the per cent of tillable land in high return crops was changed slightly in 1933; barley was moved from the (C) group to the (B) group, (see page 9 for explanation of method of calculation).

Suggestions for Improvement
