Byron G. Spencer

QSEP Research Report No. 348

February 2000

The authors are QSEP Research Associates. Frank Denton and Byron Spencer are faculty members of the McMaster Department of Economics. Christine Feaver is a research associate in the Department of Economics.

This report is cross-listed as No. 16 in the McMaster University SEDAP Research Paper Series.

The Research Institute for Quantitative Studies in Economics and Population (QSEP) is an interdisciplinary institute established at McMaster University to encourage and facilitate theoretical and empirical studies in economics, population, and related fields. For further information about QSEP and other reports in this series, see our web site <http://socserv2.mcmaster.ca/~qsep>. The Research Report series provides a vehicle for distributing the results of studies undertaken by QSEP associates. Authors take full responsibility for all expressions of opinion.

PROJECTIONS OF THE POPULATION AND LABOUR FORCE TO 2046:
THE PROVINCES AND TERRITORIES

Frank T. Denton, Christine H. Feaver, and Byron G. Spencer
McMaster University

ABSTRACT

Projections of the Population and Labour Force to 2046: The Provinces and Territories

Frank T. Denton, Christine H. Feaver, and Byron G. Spencer

McMaster University

This report makes available projections of the population and labour force of each of the provinces and territories of Canada. The projections extend to 2046, and are based on information that is up-to-date at the time of release. The report provides an indication of the capabilities of the *MEDS* software on which the projections are based.

1. INTRODUCTION

This is the second of two reports designed to make available projections of the Canadian population and labour force, and to draw to the attention of interested readers the availability of the computer software on which they are based. The first report is concerned with projections at the all-Canada level; it is available as QSEP Research Report No. 347 and as SEDAP Research Paper No. 15. The present report is concerned with projections for the provinces and territories, although results obtained by aggregating the provincial and territorial projections are shown also at the all-Canada level and at the level of six regions.

The projections extend to 2046, a period of 50 years starting from the 1996 census of population. The assumptions on which they are based are described below and selected results are displayed in the accompanying charts and tables, without analysis. Our intention is to provide a set of projections based on information that is up-to-date at the time of release. Beyond that, the material presented here can serve as an indication of the capabilities of the software.

The computer software used in making the projections is referred to as *PMEDS-D*, the current demographic component of the *MEDS* software system. *MEDS* is an acronym for “Models of the Economic-Demographic System”. The *P* refers to “provincial”, indicating that projections at the provincial and territorial levels are possible, as well as at the all-Canada level and the level of regions defined as user-determined combinations of provinces and territories. The *D* refers to the “demographic” component of *MEDS*. (A companion model, *MEDS-E* for “economic”, provides medium- to long-term projections of macroeconomic aggregates at the all-Canada level, with

particular attention to the role of population change.) In displaying the output of *PMEDS-D*, projection results are shown here at five-year intervals to 2046, with historical values for 1991 and 1996. The results reported relate in most cases to males and females combined, in broad age groups, where relevant. However, *PMEDS-D* projects the population one year at a time, by single years of age, separately for each sex, and the full range of age-sex information is available to a user of the software for all years of the projection period. *PMEDS-D* will combine provinces and territories into any desired set of up to six regions. (The default set is Atlantic, Quebec, Ontario, Prairies, BC, and Territories.) Accompanying the software is a file with the default set of “standard” assumptions on which this report is based. The software includes also two files with assumptions used in generating “higher growth” and “lower growth” projections. More generally, a user has considerable freedom to determine both the assumptions and the types of results to be displayed. A user is able also to keep the projection base up to date by adding new fertility, migration, labour force, or other data as they become available. Further information about the *MEDS* software system and how to obtain it is provided at the web site for the McMaster Research Institute for Quantitative Studies in Economics and Population -- <http://socserv2.socsci.mcmaster.ca/~qsep/>.

2. THE ASSUMPTIONS UNDERLYING THE PROJECTIONS

The assumptions are as follows. In each case the values cited are the latest available at the time of release.

Fertility: The total fertility rate in each province or territory is assumed to remain at its 1997 level throughout the projection period. The age distribution of fertility over the

childbearing years is assumed also to remain as it was in 1997.

Immigration: Annual immigration to Canada is assumed to increase from 173,000 in 1998-99 to 200,000 in 1999-2000, then to increase further in equal annual increments to a level of 225,000 in 2004-2005, and to remain at that level thereafter. The proportion going to each province is assumed to move from its 1998-99 level to the most recent five-year average level by 1999-2000, and to remain at that level thereafter. The age-sex distribution of immigrants into each province is assumed to continue to reflect recent experience.

Emigration: Annual emigration from each province is specified as a percentage of the previous year's population in that province. It is assumed that in each case the province-specific emigration rate moves from its 1998-99 value to its latest three-year average by 1999-2000, and remains at that level thereafter. The age-sex distribution of emigrants from each province is assumed to continue to reflect recent experience.

Interprovincial Migration:

In-migrants (from the rest of Canada) and out-migrants (to the rest of Canada) are treated separately. The latest estimates relate to 1998-99. The assumed flows for 1999-2000 are based on an average of the previous five years; by 2009-10 the inflows and outflows for each province are assumed to be in balance, and are set equal to the average of the two flows in 1999-2000; values for the intervening years are calculated by linear interpolation. No further change is assumed after 2009-10: the inflows and outflows for each province and territory are thus assumed to remain in balance throughout the remainder of the projection period.

Mortality: Age-specific mortality rates are projected separately for each sex in each province and territory. Our standard assumption is that they continue to fall throughout the projection period, but at a reduced pace. An implication (at the all-Canada level) of the assumptions is that life expectancy at birth for males increases from 74.6 in 1991 to 78.9 in 2021, and to 80.9 in 2046, for a total increase of 6.3 years. The corresponding changes for females are from 80.9 in 1991 to 83.2 in 2021 and 84.8 in 2046, for a total increase of 3.9 years.

Labour Force Participation Rates:

Age-specific labour force participation rates in each province or territory are projected for each sex separately; the labour force age groups, as defined by Statistics Canada, are 15-19, 20-24, 25-34, 35-44, 45-54, 55-64, and 65 and over. The rates are allowed to continue to change until 2011, generally in accordance with recent historical trends; after that they remain constant.

Households: Underlying the projection of the number of households for each province or territory is a set of age-sex-specific primary household maintainer rates; consistent with recent historical experience, the default assumption is that these rates remain constant; however, users are able to specify the value of a trend factor that adjusts the rates up or down; the default value of this factor is 1.0 (i.e., no trend) in the projections reported here.

3. PRESENTATION OF THE PROJECTION RESULTS

Selected results based on the foregoing assumptions are shown for each of the provinces, for the Yukon Territory, and for the Northwest Territories and Nunavut combined. Results for Canada

are obtained by aggregation. It should be noted that they differ slightly from projections made directly at the all-Canada level.

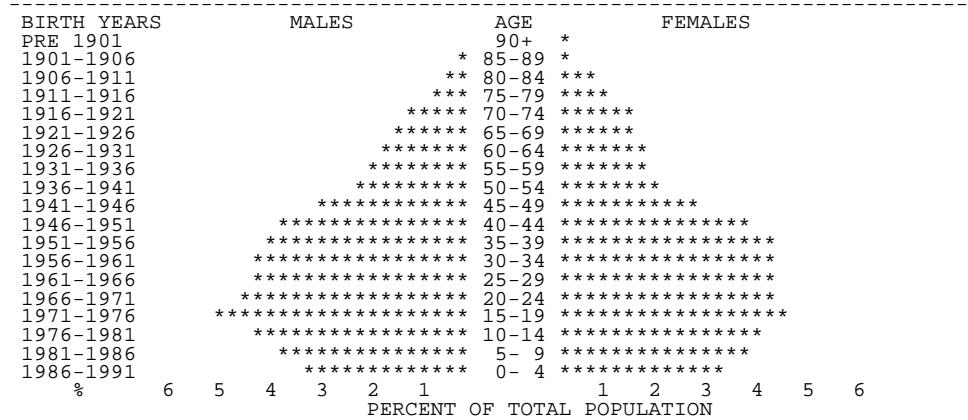

PMEDS-D allows population pyramids to be generated for user-selected years. To illustrate, in the next section we provide plots for the years 1991, 2011, and 2031 for each province. We note that, roughly speaking, members of the baby boom cohort were in the age range 25 to 44 in 1991. In 2011 they will be in the range 45 to 64, and in 2031 in the range 65 to 84. The relative size and progression of the cohort shows up clearly in the pyramids.

The tabular material presented in section 5 illustrates the *PMEDS-D* output that is available when the program is run for “All Provinces”. Sections 6 through 17 are illustrative of what is available for individual provinces/territories. Finally, section 18 shows selected results for regions. (As noted, provision is made for up to six regions, but the provinces and territories can be combined into other regions by a user.)
