2008

The regional estimates were produced as part of the research project on "Unità d'Italia e sviluppo disuguale: la struttura creditizia e la crescita industriale per regioni dal 1861 al 1913" of the Ufficio Ricerche Storiche of the Bank of Italy. The authors alone are responsible for the material presented here.

METALMAKING IN ITALY, 1861-1913: NATIONAL AND REGIONAL TIME SERIES

Abstract

This paper presents national and regional time-series estimates of metalmaking production in post-Unification Italy. The former broadly confirm their immediate predecessors; the latter are altogether new. The regional series evidence the industry's geographic concentration: the significant producers were Piedmont, Liguria, Lombardy, Tuscany, Umbria, and Campania, but production per capita significantly exceeded the national average only in Liguria and, in the later years, in Umbria and Tuscany.

LA METALLURGIA IN ITALIA, 1861-1913: SERIE NAZIONALI E REGIONALI

Sommario

Questo saggio presenta stime annuali della produzione delle industrie metallurgiche nell'Italia post-Unitaria, sia nazionali, sia regionali. Le prime confermano a un dipresso le stime aggregate precedenti; le seconde sono del tutto nuove. Le serie regionali evidenziano la concentrazione della produzione. Questa era rilevante solo in Piemonte, Liguria, Lombardia, Toscana, Umbria e Campania; pro capite, superava di molto la media nazionale solo in Liguria e, dopo i primi decenni, in Umbria e in Toscana.

This paper presents national and regional time-series estimates for the metalmaking industry in post-Unification Italy. The former improve on those in the literature; the latter are the first of their kind. Both sets distinguish ferrous and non-ferrous metals, and, within these, the initial production of the metal, and its subsequent transformation into semi-finished goods.

The text below provides a summary account of the underlying sources and methods, and a brief description of the patterns that emerge from the new estimates. At the national level, these confirm the strong cycle in aggregate production, and specifically, as is evident from the industry-specific series, in the production of ferrous metals. The new regional series document the concentration of production in a handful of regions (Piedmont, Liguria, Lombardy, Tuscany and Campania, joined eventually by Umbria). Regional shares varied as large plants came on stream, but these changes tended to offset each other over time. In 1913, as in 1861, the "industrial triangle" in the North-West held about half the total; the Center/North-East improved from a quarter of the total to a third, while the South slipped from a quarter of the total to a sixth.

1. National production

The new national estimates of the physical production of metals are collected in Appendix A, Panel 1. Total production is tracked, exhaustively, by four series for ferrous metals, and twelve for non-ferrous metals; all are derived directly or indirectly from the reports of the *Corpo delle miniere*.¹ The time series for pig iron, rails, ingot aluminum, and mercury reproduce the data with minimal corrections; the series for antimony, ingot copper, gold, silver, and ingot lead extensively correct the figures in the sources; the series for semi-finished aluminum, lead and lead alloys, tin, and zinc are estimated from the apparent consumption of ingot and scrap metal; the series for semi-finished wrought iron and steel, and copper and copper alloys, are hybrids, estimated from apparent input consumption over the first two to three decades, and subsequently by amending the available data; and the cast iron series interpolates early and late benchmarks on the assumption of a smoothly declining ratio of cast iron to wrought iron and steel in final consumption. These are aggregated with the 1911-price value added weights collected in Appendix A, Panel 2; all are derived from evidence on output and input prices, and technical coefficients. The resulting aggregates are presented in Appendix A, Panel 3, and illustrated in Figure 1.

The new estimates of aggregate production essentially confirm their immediate predecessors in the public domain.² The sub-aggregates, which appear here for the first time, show that the production of ferrous metals was not only much larger than that of non-ferrous metals, but more cyclically sensitive. Over the 1860s and 1870s these two subaggregates moved roughly in unison; after 1880 the production of ferrous metals grew faster in the upswings of the 1880s and early 1900s, and fell further (and took longer to recover) in the depression of the 1890s.

¹The main sources are Direzione generale della statistica, *Statistica del Regno d'Italia. Industria mineraria. Anno 1865*, Milan and Florence, 1868; *Corpo delle miniere, Notizie statistiche sull'industria mineraria in Italia dal 1860 al 1880*, Rome, 1881; Id., *Relazione sul servizio minerario*, annual (1877-82); Id., *Rivista del servizio minerario*, annual (1883 ff.).

²S. Fenoaltea, "Notes on the Rate of Industrial Growth in Italy, 1861-1913," *Journal of Economic History*, 63, 2003, pp. 710-11. The new estimates are generally higher, as some 1911-price estimates were revised upward (compare Appendix A, Panel 2, and S. Fenoaltea, "Il valore aggiunto dell'industria italiana nel 1911," in G. M. Rey, ed., *I conti economici dell'Italia. 2. Una stima del valore aggiunto per il 1911*, Bari, 1992, pp. 146, 148), and more volatile in the early decades, as the estimates of input supply that underlie the ferrous-metals output estimates are less vigorously smoothed.

Half a dozen physical production series, also derived from the reports of the *Corpo delle miniere*, have long been available in the official abstract of historical statistics.³ The new series essentially confirm those for pig iron, ingot aluminum, and mercury, and extensively revise those for iron and steel, ingot lead (in the early decades), and ingot copper. The other new series fill the gaps in the earlier source; in 1911, these cover one sixth of ferrous metals production, and four fifths of non-ferrous metals production.

2. *Regional production*

The elementary regional estimates are all, by construction, disaggregations of corresponding national series. The regional physical series for pig iron, rails, ingot aluminum, antimony, ingot copper, gold, silver, ingot lead, and mercury simply subaggregate the local data, corrected as in the national series, to the regional level. The national wrought iron and steel tonnage figures are instead allocated among the regions using the *Corpo delle miniere* data on workers and installed horsepower (in preference to the output data, muddled by the varying incidence of vertical integration). Because of data limitations, the physical cast iron series is allocated using annual shares estimated from census-year benchmarks, amended as necessary in light of the limited output data provided by the *Corpo delle miniere*. Even more severe data limitations preclude the regional disaggregation of the physical series for semi-finished non-ferrous metals. Only their value-added-weighted sum is allocated among the regions; as with the cast iron series, the allocation interpolates census benchmark shares, allowing for the partial data provided by the *Corpo delle miniere*. The latter are limited to the semi-finished copper and copper alloys produced from 1885 by major firms, but they usefully document the subsequent opening of major plants in Tuscany.

The elementary regional series are presented in Appendix B. The non-zero physical series are collected in Panels 1 - 2, and the residual estimates of value added in the production of semi-finished non-ferrous metals appear in Panel 3. The region-specific sums of the physical series in Panels 1 - 2, weighted by the corresponding unit value added estimates (the national figures in Appendix A, Panel 2), and their (non-ferrous) complements in Panel 3 are the regional aggregates presented in Appendix C.⁴

Map 1 illustrates the regions' annual average metalmaking product over the period at hand. The industry was concentrated in a bare handful of regions. Liguria was the leader, with some 9 million 1911 lire per year, followed by Lombardy and Tuscany with 7 million each, and then by Piedmont, Umbria, and Campania with 3 to 4 million each; less than that was contributed by the ten other regions combined.⁵

Figure 2 illustrates the path of production in the six regions that mattered.⁶ In 1861, the leader was Lombardy, with just over 2 million lire, closely followed by Campania; Piedmont, Liguria and Tuscany yielded just over 1 million each, Umbria a mere tenth of that. Between 1861 and 1880 production slipped in Campania, and grew moderately in the other five regions. Through most of the 1880s production grew smartly in all six regions; the

³Istat (Istituto centrale di statistica), *Sommario di statistiche storiche italiane, 1861-1955*, Rome, 1958, p. 129.

⁴The ferrous-metal subaggregates are of course derived from Panel 1, and the non-ferrous-metal subaggregates from Panels 2 - 3.

⁵These ranged down from Venetia, just under one million lire per year, to Basilicata, with practically nothing.

⁶In almost all the omitted graphs, to the same scale, the production series are not perceptibly above the horizontal axis. The lone exception is Venetia, where total production was typically between the production of non-ferrous metals alone in Piedmont and in Lombardy.

sharpest increases were in Liguria, in Tuscany, with the opening of the Limestone and Torretta copper works, and of course in Umbria, with the opening of the Terni steel works. The subsequent depression was also felt everywhere, but not uniformly so: the late-1880's production peak was exceeded by 1895-98 in most regions, but not until 1905 in Lombardy and in Umbria. The pre-War boom was also shared, but again not uniformly so. Comparing output at its pre-War peak and at its late-1880s peak, Umbria's product increased just 40%; Liguria's and Lombardy's increased threefold, Tuscany's fourfold, Piedmont's fivefold, and Campania's no less than elevenfold. In Piedmont, Liguria, and Lombardy, too, growth appears relatively broadly based, and distributed over time; in Tuscany and Campania it was particularly concentrated, and tied to the construction of major integrated steel works at Piombino, Portoferraio, and Bagnoli. By 1913 the major producers were Liguria, Lombardy, and Tuscany, all just over 25 million 1911 lire (but with Liguria and Tuscany down from a peak of some 30 million, and Lombardy instead growing steadily); Campania was nearer 20 million, Piedmont under 15 million, and Umbria nearer 10 million. The other ten regions, together, contributed just 7 million more.

Figure 3 compares the metalmaking product, and the shares of the national total, of the North-West, the Center/North-East, and the South (and major islands). From 1861 to 1905, relative movements are easily summarized. The South's share declined from one quarter initially to one tenth by 1890, and then remained there; the Center/North-East maintained a 25-to-30% share from 1861 to 1885, surged to 40% by 1890, and then also remained there; the North-West increased its initial 50% share to 60% by the early 1880s, reverted to 50% by 1890 as the Center surged, and then also remained there. After 1905 regional shares fluctuate sharply, as major plants come on stream in all three areas, but not simultaneously; the South claimed the last, and the only net gain.

Table 1 scales the metal production estimates to gauge the local significance of the industry at the census-year benchmarks; Figure 4 illustrates these scaled figures, with the regions on the horizontal axis, ordered as in the Table. In cols. 1 - 4 (Figure 4A) metal production is divided by the preliminary estimates of total industrial production.⁷ Metalmaking grew rapidly, but was ever a very minor part of Italy's industry. In the major areas its local share was well below the national average in the South (but least so in 1911), near it in the Center/North-East, and above it in the North-West (but much more so earlier than later). At the regional level metalmaking's share of industry was often negligible; but it varied sharply even within the major producers. Its share was largest in Umbria in the later years, where it reached double digits; it was smaller, but still double the national share, or more, in Liguria, in Tuscany, and, in 1911, in Campania too. Piedmont and Lombardy were also major producers of metal; but in both regions metalmaking's share was limited by the vigorous development of other industries, and over time it slipped below the national average.

In cols. 4 - 8 (Figure 4B) metal production is divided by the male population of working age, which proxies for the aggregate regional economy.⁸ The broad patterns, by major area and region, tend to replicate those just seen. Piedmont and Lombardy turn out to be major producers with a below-average per-capita product (in essence, a comparative

⁷The aggregates reflect ongoing research; with respect to the original estimates in S. Fenoaltea, "Peeking Backward: Regional Aspects of Industrial Growth in Post-Unification Italy," *Journal of Economic History* LXIII (2003), pp. 1088-1091, these incorporate largely unpublished new estimates for the extractive industries, the textile and (non-leather) apparel industries, the non-metallic mineral products industries, the chemical and related industries, the utilities industries, and the construction industries.

⁸*Ibid.*, p. 1069.

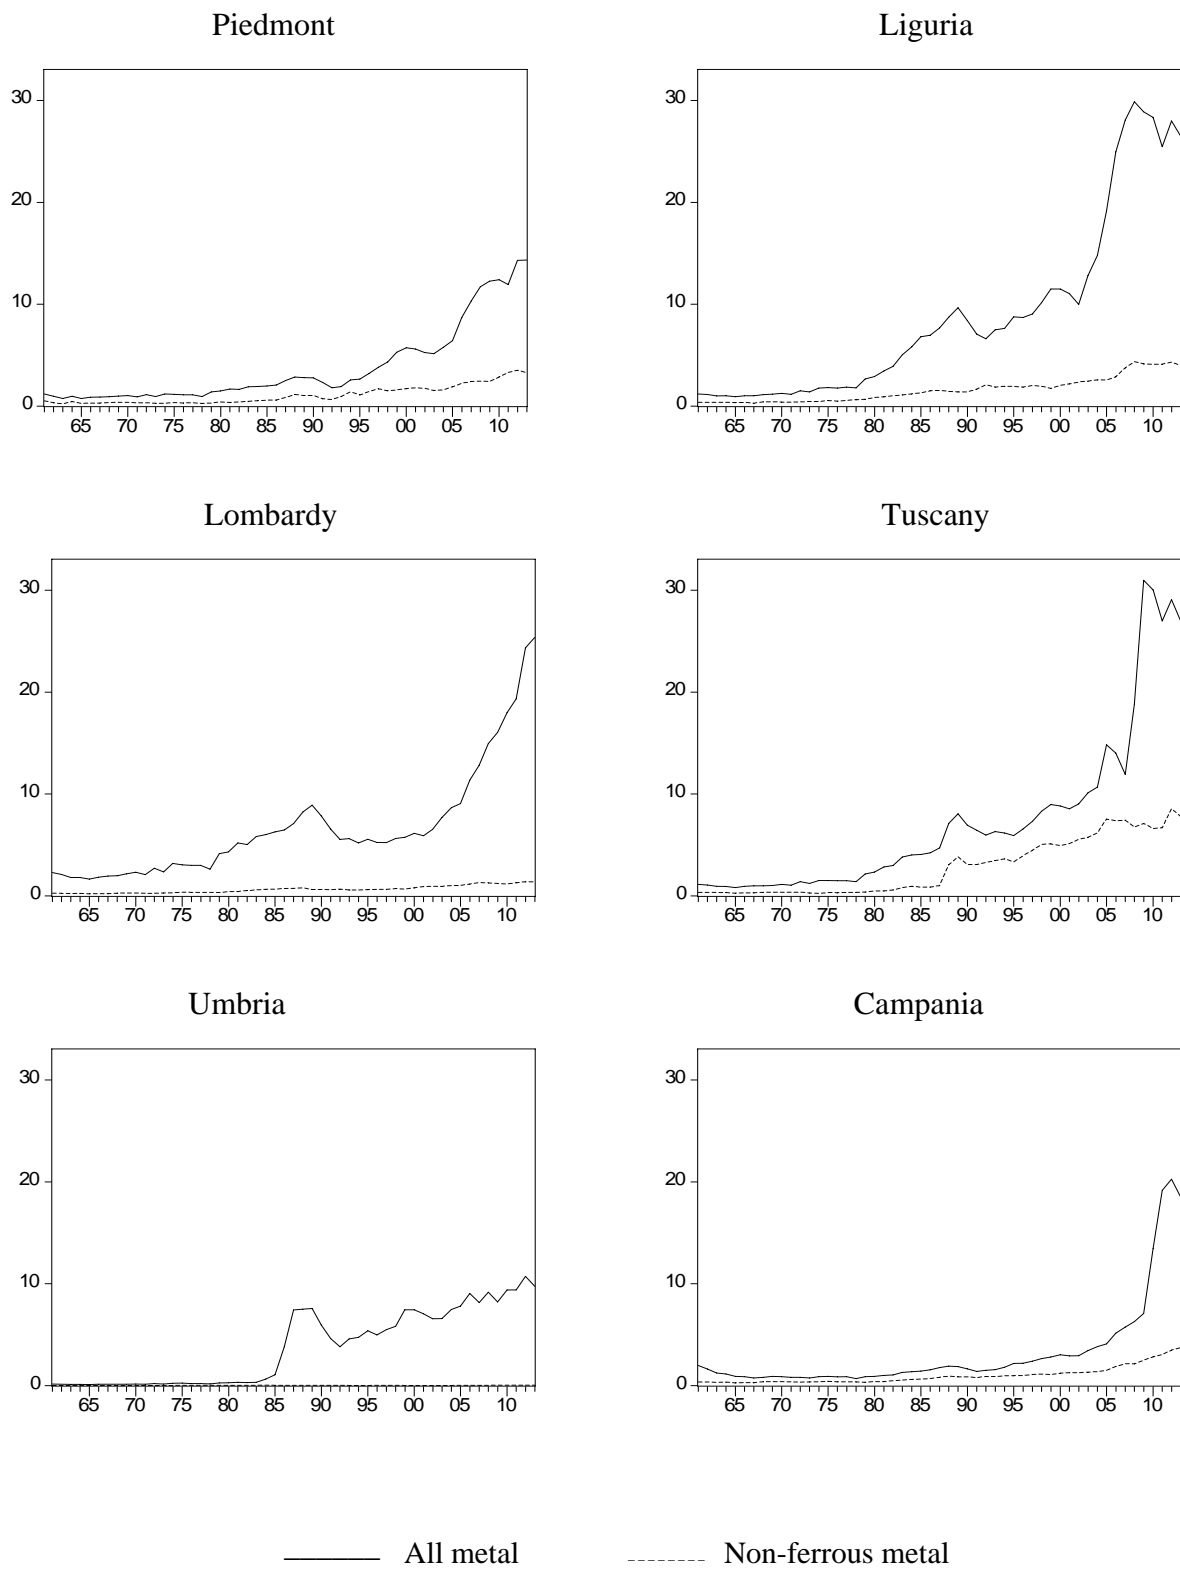

disadvantage), while Campania performs indifferently even in 1911, when it just exceeds the national average. The strong performers, with a per-capita product near or above twice the national average, were Tuscany in 1911, Umbria in 1901 and 1911, and--in all four census years--Liguria.

Appendix A (continued)

2. Value added in 1911

Product	Value added per unit	Value added (million lire)
<i>Ferrous metals</i>		
pig iron	8.0 lire/ton	2.423
rails	48.0 lire/ton	5.157
other wrought iron and steel	90.0 lire/ton	73.170
cast iron	120.0 lire/ton	17.400
<i>Non-ferrous metals</i>		
ingot aluminum	400.0 lire/ton	.319
semi-finished aluminum	700.0 lire/ton	.503
antimony	230.0 lire/ton	.000
ingot copper	700.0 lire/ton	1.166
semi-finished copper	450.0 lire/ton	12.735
gold	400.0 lire/kilogram	.010
silver	3,500.0 lire/ton	.044
ingot lead	53.2 lire/ton	.894
semi-finished lead	85.0 lire/ton	2.559
mercury	1,000.0 lire/ton	.955
semi-finished tin	300.0 lire/ton	.390
semi-finished zinc	100.0 lire/ton	.660

3. Value added at 1911 prices, 1861-1913 (million lire)
