June 18, 1998

Abstract: Eight times a year, approximately two weeks before every FOMC meeting, the Federal Reserve releases a description of economic conditions in the twelve Federal Reserve districts. Called the Beige Book, this description relies primarily on surveys and anecdotal evidence gathered by the twelve district banks. In this paper, we read and numerically scored past Beige Books in order to determine the extent to which the descriptions in these books accurately reflect current economic activity as measured by quarterly real GDP growth. We find that both in-sample and out-of-sample, the quantitative Beige Book indices do have significant predictive content for current and next quarter real GDP growth. Furthermore, the Beige Book has information about current quarter real GDP growth not present in other indicators such as the Blue Chip Consensus Forecast or time series models that use real-time data.

* This research was begun while D'Ann Peterson was an Economist in the Research Department of the Federal Reserve Bank of Dallas. Thanks to Tom Fomby, Evan Koenig, and Fiona Sigalla for providing helpful comments on a draft of this paper. Thanks also to Sheila Dolmas, Carrie Kelleher, Niki Maas, Jeremy Nalewaik, Michelle Thomas, and especially Margie Evans for help in preparing the Beige Books for this study. We are especially grateful to Evan Koenig and Sheila Dolmas for making their real-time data set available to us. The views in the paper in no way reflect those of the Federal Reserve Bank of Dallas or the Federal Reserve System. Corresponding author: Nathan S. Balke, Department of Economics, Southern Methodist University, Dallas, TX 75275, (214) 768-2693, nbalke@post.smu.edu.

In the conduct of monetary policy, the Federal Reserve must make policy decisions in the presence of a great deal of uncertainty. Not only is there uncertainty about the direction of future economic activity, but there can even be substantial uncertainty about current economic conditions. Preliminary estimates of real GDP typically become available one month after the quarter has ended and are frequently revised months and even years later. Economic statistics such as industrial production or retail sales, while being more timely than quarterly real GDP estimates, only partially reflect aggregate economic activity. As a result, considerable attention has been given to forecasting both current and near-term economic activity (see for example, Braun (1990), Trehan (1989) and (1992), Miller and Chin (1996)). Unfortunately, as the recent study of Koenig and Dolmas (1997) points out, forecasts of current quarter real GDP growth are can be quite inaccurate.

Because of the difficulty of ascertaining current economic conditions from quantitative data, the Federal Reserve considers not only quantitative but also qualitative information about current economic conditions in its policy deliberations. Indeed, the discussion at FOMC meetings often includes anecdotes relating to current economic conditions. Among the sources of qualitative information about current economic conditions available to the Federal Reserve is a summary of economic conditions in the twelve Federal Reserve Districts, referred to as the Beige Book. The potential advantage of the Beige Book is that it provides policy makers with timely information about current economic activity across the twelve Federal Reserve districts.

Academic economists have generally been skeptical about the use of anecdotal evidence and

for good reason.¹ By their very nature, the accuracy of anecdotal or narrative accounts is difficult to evaluate. Too often, one does not have a systematic historical record of anecdotal evidence to check against actual economic performance. In addition, even if a historical record of anecdotal accounts exists there is still the problem of how to quantify and evaluate these narrative accounts. It is difficult to gather information contained in the anecdotal accounts and to systematically learn from them.

In this paper, we attempt to quantify and then evaluate the information contained in the Beige Book. There is nearly a fifteen year record of Beige Book commentary to draw upon and, because of its explicit focus on current economic conditions, the Beige Book can be readily compared with more quantitative measures of economic activity such as GDP or industrial production. To assess the accuracy of the Beige Book, we read each Beige Book and gave numerical scores for the discussion in the national and sectoral summaries as well as the description of economic activity in each of the twelve Federal Reserve Districts.

We find that our quantified measures of the Beige Book track current real GDP growth quite well. Furthermore, the Beige Book has predictive content for current and next quarter real GDP growth above and beyond that of alternative indicators such as the Blue Chip forecast or time series models based on real-time data. This holds both in-sample and out-of-sample. In particular, the Beige Book seems to catch turning points sooner than most of the alternative indicators.

The outline for the remainder of the paper is as follows. Section two contains a brief

¹ Alan Blinder (1997) refers to the Fed's use of anecdotal evidence as the "ask your Uncle" method of gathering information about the economy.

description of the Beige Book and how it is compiled by the District Banks' research departments. In section three, we describe how we assigned numerical values to the Beige Book descriptions and the precautions we took to avoid inadvertently influencing the outcome of our study. In section four, we compare the Beige Book to actual real GDP growth while in section five we evaluate the Beige Book's ability to forecast real GDP content relative to alternative indicators of aggregate economic activity. Section six concludes.

2. Description of the Beige Book

The Beige Book contains a written description of economic activity in each of the twelve Federal Reserve Districts. It is released eight times a year, roughly two weeks before each FOMC meeting. Each district report is three pages long and includes a paragraph summarizing economic activity within the district and a more detailed description of activity in particular sectors such as retailing, manufacturing, construction, and others. While only sporadically present in some of the older Beige Books, recent Beige Books have also contained descriptions of wage and price pressures in the districts. In addition to district reports, the Beige Book contains an introductory paragraph that summarizes national economic conditions and a three to five page summary of national conditions in sectors such as retailing, manufacturing, construction, real estate, agriculture and natural resources as reported by the twelve Federal Reserve District Banks. Both the national overview and national sectoral summaries draw on the reports of twelve regional banks.

What are the inputs that go into creating the Beige Book? Each individual District Reserve Bank is responsible for gathering and reporting on economic conditions in its district and is

relatively free to emphasize which aspects of economic activity it deems important. In addition, one bank (which is randomly rotated among the regional banks) is responsible for compiling the district write-ups and for writing the national summary. While some district reports may contain publicly available statistical information such as employment growth or retail sales within the district, the primary focus of the regional reports is an assessment of the anecdotal evidence gathered by each of the District Banks. Surveys are conducted by each bank's research department (or in one case the public affairs department), with analysts and economists surveying a list of "contacts" within their district. These may include businesses, banks, industrial and trade associations, local governments, and even members of the Board of Directors of the District Bank. Other information, including statistical releases or even local newspaper reports, are sometimes gathered and reported. All this information is filtered by analysts in the District Banks and summarized in each District Bank's Beige Book report. It is important to remember that in quantifying the Beige Book we cannot separate out the marginal contribution of each of the sources of information; we can only assess the overall information content of the Beige Book. Our sense is that the value added of the analysts is quite high in that they decide on what information to gather, how to assess that information, and how to communicate that information in the Beige Book.

3. Scoring the Beige Book

The Beige Book was first publicly released in July 1983, thus we read each Beige Book beginning with the July 1983 and ending with the January 1997 issue. We read and scored each Beige Book in terms of (i) the national summary of economic conditions, (ii) the national

summary of sectoral economic activity (iii) the district banks' reports on economic conditions within their districts. The national sectors graded were retail, manufacturing, finance or banking sector, construction, and natural resources (which typically reflects reports on agriculture, petroleum, lumber, etc.). National summaries on these sectors are available for nearly every Beige Book (although not all district banks report on these sectors in every Beige Book). When grading the report in terms of individual district economic activity substantial weight was given to the summary paragraph of regional conditions, but we did read and factor in the description of sectors within each region in our evaluation of the regional economic conditions.

Calibrating the Beige Book scores

In order to quantify and formally evaluate the information content of the Beige Book, one must be able to assign a numerical value to its description of economic conditions.² Before a numerical score could be assigned, we had to decide what to look for when reading the Beige Book. The Beige Book descriptions contain information about many dimensions of economic activity including the level and growth rate of output, employment, and prices. However, when scoring the Beige Book, we chose to read them primarily for the information they implied about the current quarter output growth. Reading the Beige Book in terms of its information about output growth allows us to relate the Beige Book to more standard quantitative measures of economic activity such as real GDP growth. While we read the Beige Book in terms of current

² Other studies that have attempted to quantify qualitative or subjective data include Havrilesky's studies of political influence on monetary policy (Havrilesky (1990, 1991)) and more recently Hamermesh and Biddle's studies on beauty and earnings (Hamermesh and Biddle (1994) and Biddle and Hamermesh (1998)).

growth, there were instances in which the Beige Book discussion seems to refer to the change in economic growth. For example, a phrase like "economic growth slowed in the district since the last Beige Book" suggests that the focus is on the change in growth. Unfortunately, it took too much effort to evaluate each and every Beige Book description in terms of its information about both the rate of growth and the change in the rate of change.

As to the particular numeric values, we scored each category on a scale from -2 to 2. Converting a verbal description to numerical value is not always straightforward. We adopted the convention that if the Beige Book description appeared to suggest "moderate" or "normal" economic growth then this would typically be scored a 0.5. A description implying "strong" economic activity might rate a score of 1.0 or 1.5. Key words could be helpful in our scoring but we did not rely on them exclusively. We read the entire description in each Beige Book category and then used our judgement (much as actual readers of the Beige Book would) when assigning a score.

Precautions taken against reading too much into the Beige Book.

After agreeing to the basic format for scoring, the two authors read the Beige Book independently of each other. Thus, while both readers scored the various beige book categories according to roughly the same scale, the actual interpretations and, hence, the scores of individual beige books could (and did) differ between readers. It turns out that the correlation between the beige book scores of the two authors averaged about 0.75 and ranged from a high of .82 (for national retail sector) to low of .65 (for Tenth District description of economic activity). We took as our Beige Book score for each category the average of the two authors' scores.

We also took precautions against inadvertently using our knowledge of actual economic outcomes from coloring our scores of the Beige Book descriptions. First, in order to make it more difficult to determine which time period a particular Beige Book referred to, we "whited out" all references to the calendar year in each and every Beige Book.³ Furthermore, we randomly ordered the Beige Books so that the order in which they were read did not correspond to the actual sequence. Thus, when reading the Beige Book we did not know the actual time period to which the Beige Book referred. Once the Beige Books were read and graded, we reordered the Beige Book scores in their proper temporal sequence. Note that in some sense, by reading the Beige Book out of sequence we may understate its information content. References are sometimes made to previous Beige Books which makes scoring the discussion more difficult. Also, by reading the Beige Books out of sequence we risk reading it out of context. Knowing the period in which the Beige Book discussion occurs might enable the reader to draw a clearer inference from the Beige Book report.

Timing of the Quantified Beige Book Series

As mentioned above the Beige Book is compiled eight times a year and released roughly two weeks before the scheduled FOMC meeting. As a result, unlike real GDP or other traditionally used time series data, the time period to which the Beige Book refers does not correspond exactly to a particular quarter or month. Since June 1987, every Beige Book notes the closing date for

³ Unfortunately, it was not practical to white out references to the month of the year or to references to particular events such as the Olympics or the Persian Gulf War that would allow one to infer what the calendar year was.

which the information was gathered. This date is typically a week or more before the official release date. Because the reports are prepared over the course of the month before the release date, the actual information in the report reflects economic activity during the six to eight weeks before the release of the Beige Book. In addition, the irregular release of the Beige Book makes it more difficult to compare with regularly published quantitative measures of economic activity. As a result, some care was taken in attributing which month a particular Beige Book pertained to. This was done so that we could compare the information content of the Beige Book with other more traditional indicators of economic activity such as GDP or Industrial Production.

Table A1 in the Appendix notes the release date as well as the closing date of the Beige Book and the month/quarter to which we attributed the Beige Book to in our statistical analysis below. For example, a Beige Book was released in December 1996 (12/04/96) yet the closing date of that Beige Book survey was 11/23/96. In this case, we attributed that Beige Book as containing information for November 1996. The January 1997 Beige Book was released 1/22/97 with a closing date of 1/13/1997. Because the closing date was less than two weeks into the current month, we attributed this Beige Book to December 1996. For comparison, Table A1 also reports the release dates for comparably timed Blue Chip Forecast, monthly Industrial Production, monthly Employment growth, and quarterly real GDP estimates. As one can see, our dating of the Beige Book is fairly conservative as the release dates and, even more often, the closing dates of the survey typically occur before the release dates of the other series.

Summary statistics of the Beige Books scores

All together, we have eighteen quantitative measures from each beige book: one national

summary, five national sectoral measures, and twelve Federal Reserve District measures. Because in this paper we are primarily interested in the ability of the Beige Book to track aggregate economic activity, we also aggregated the sectoral Beige Book scores into a single index by taking a simple average of the scores for retailing, manufacturing, finance, and construction.⁴ Similarly, we constructed an index based on the simple average of the twelve district summaries. These simple indices allow for summary measures of the information provided by the sectoral and district summaries. In addition to these aggregate indices, we also consider the disaggregated sectoral and district measures in our analysis below.⁵ Thus, we have a total of twenty Beige Book indices.

Figure 1 plots the three aggregate Beige Book indices: the national summary, the aggregated sectoral summaries, and the aggregated district summaries. As one can see from the figure these series are highly correlated. They show much the same cyclical pattern with the 1990-91 recession and the 1983-84 recovery showing up prominently in all three indices. The sample average and standard deviations of the various Beige Book measures are presented in Table 1. Most of the sample averages range between 0.50 and 0.65 which would typically be associated with a description of "moderate" or "normal" economic growth. The exception is the sample

⁴ We did not include the score for natural resources in the average since a priori one might expect strong activity in sectors such as agriculture or oil and gas extraction which feature prominently in the Beige Book discussion on natural resources to be negatively correlated with overall economic activity.

⁵ We made no attempt to create indices weighted by sector or district size. Given that we were not sure what an individual beige book score reflects, it seemed sensible to look at the simple average as an aggregate measure of the information in the sectoral and district summaries. Even so, it's not clear that for the purposes of predicting current or next quarter real GDP using weights based on the size would be optimal. Because we also consider the disaggregated sectoral and district scores in our regression analyses below, one might consider those to be the "optimal" index given a criterion of minimizing squared regression errors.

average of the natural resource sector's score which is well below the other sectors. The low score reflects the generally slow growth in the energy sector during the mid and late 1980s and the 1990s.

3. The Predictive Content of the Beige Book for Real GDP Growth

While there are several dimensions in which the Beige Book can be evaluated, in this paper we evaluate the Beige Book in terms of its ability to predict current and next quarterly final real GDP. We use final real GDP (including revisions and re-benchmarking) rather than preliminary estimates of real GDP, as we consider final real GDP numbers to be a better measure of "true" aggregate activity. As a first look at how well the Beige Book tracks economic activity, Figure 2 plots real GDP growth and the average of the Beige Book sectoral scores. The figure suggests that the Beige Book index tracks real GDP pretty well. Not only does it capture the 1990-91 recession and the 1983-84 recovery, it even matches some of the ups and downs in quarterly real GDP growth.

Tables 2 through 4 present a more formal examination of the information content of the Beige Book. Table 2 presents regression results of current and next quarter real GDP growth against our three aggregate Beige Book measures.⁶ Without exception, each of Beige Book aggregates has significant explanatory power for current real GDP growth. This is quite remarkable given that final real GDP numbers are not available until several months have passed

⁶ Because our focus is on the information content of the Beige Book and because of the irregular dating of the Beige Book releases, the unit of observation is the Beige Book release as discussed in the previous section. That is, for each year there will be eight observations that relates Beige Book to aggregate economic activity.

and are often revised years after the fact. Both the average of regional summaries and the average of sectoral summaries regressions have adjusted R-squares near or above 50 percent. Furthermore, the regional and sectoral Beige Book descriptions have information above and beyond that contained in the national summary. Even though the Beige Book is not meant to be forward looking, it also has predictive content for next quarter real GDP. Again, individually, all three aggregates are statistically significant, although the adjusted R-squares are about half the size as those for the current quarter GDP regressions. Thus, the Beige Book aggregate indices clearly have predictive content for near term real GDP growth.

Table 3 displays the results when the individual Federal Reserve District scores are included in the GDP regression. Of the twelve districts only the Atlanta and Philadelphia district summaries are significant at the five-percent level. Nonetheless, the sum of the coefficients of the regional summaries is statistically significant and is of a similar magnitude as the regional index presented in Table 2. Furthermore, the exclusion F-test implies that we can strongly reject the null hypotheses that the individual regional summaries have no explanatory power for current quarter real GDP; indeed, the adjusted R-square of 0.57 is higher than any of the regressions in Table 2. With respect to next quarter real GDP, again only a few of the regional summaries are significant at the five-percent level (New York, Richmond, and St. Louis), but both the sum of the coefficients and the exclusion tests suggest that the disaggregated regional summaries have predictive power for next quarter real GDP. Note that these regression results do not necessarily reflect the accuracy of the individual district summaries with respect to economic activity within the district, only the degree to which the district summary, along with those of other districts, predicts real GDP growth.

Table 3 also presents results for the case where the individual sectoral summaries are included as explanatory variables. In the regression on current quarter real GDP, the retail, manufacturing, and construction sector summaries were significant at the one-percent level. The sum of the coefficients of the five sectoral summaries was statistically significant, and the hypotheses that all five coefficients were equal to zero is strongly rejected. As in the previous cases, the predictive content of the Beige Book sectoral summaries is less for next quarter GDP than for current quarter GDP. Of the sectoral summaries, only the construction summary was statistically significant for next quarter GDP, although once again the five sectoral coefficients were jointly significant as was the sum of the coefficients. In summary, there is significant information about current aggregate economic conditions in the individual Beige Book descriptions of district economic activity and national sectoral activity.

Recall that the Beige Book is released roughly two weeks before the eight FOMC meetings held each year. Sometimes the Beige Book is released well before the current quarter is completed. This means that the Beige Book at times contains at best only one or two months of information about the current quarter. Table 4 displays the extent to which the aggregate Beige Book indices' information content varies depending on how far into the quarter it was released. Not surprisingly, the later the Beige Book was released during the quarter the greater its information content. The greatest increase in Beige Book's information content about current quarter real GDP occurs between one and two months into the quarter. Of the various Beige Book indices, the average of the national sectoral summaries shows less sensitivity to when it was released. For predicting next quarter real GDP growth, how far into the current quarter the Beige Book is released is less important.

On the basis of Tables 2 through 4, it is fair to say that the Beige Book summaries capture much of the same underlying economic activity that is reflected by final real GDP growth. Furthermore, the detailed individual regional and sectoral summaries provide additional information useful in predicting current and next quarter real GDP growth that is not contained in the overall national summary. This suggests that one should read the detail in the Beige Book (as reflected by the sectoral and district summaries) and not just the overall national summary.

4. Comparison of the Beige Book with Other Indicators of Economic Activity

While Tables 2 through 4 demonstrate that the Beige Book's depiction of current economic activity mirrors that of quarterly real GDP, one is also interested in how the Beige Book compares with other sources of information about current real GDP. In this section, we examine the information content in the Beige Book relative to that in other indicators of current economic conditions. Among the indicators we examine are the consensus Blue Chip forecasts for current and next quarter real GDP and time series on lagged real GDP, industrial production, employment growth, and real retail sales.⁷ All of these series are "real-time" series. That is, they are the numbers available to analysts around the time the Beige Book was released and not final, revised values that are typically available on electronic databases. This data set was painstakingly gathered by Evan Koenig and Sheila Dolmas (see Koenig and Dolmas, 1997), and we greatly appreciate them making their data set available to us. We will, however, keep as the dependent variable in our regressions the final estimate of real GDP as we assume that this

⁷ These series have been found by Trehan (1992) and by Koenig and Dolmas (1997) to be useful in predicting current quarter real GDP.

reflects the best estimate (ex post) of actual aggregate economic activity. We, also, took care that the timing of the different explanatory variables was comparable (see Table A1), so that the Beige Book was evaluated against time series available to analysts around the time of the original Beige Book release.

Table 5 compares the predictive content of the Beige Book for real GDP growth with that of the consensus Blue Chip forecast. In this comparison, we examined regressions of real GDP growth against the Blue Chip consensus forecast and six alternative Beige Book measures. The Beige Book measures considered were: the national summary score, the average of the twelve district scores, the average of sectoral scores, the twelve district scores disaggregated, the five sectoral scores disaggregated, and the case where all three aggregate indices--national summary, average of regional scores, and average of sectoral scores--were included.

From Table 5, we can see that in every single regression, regardless of whether current or next quarter real GDP growth is the dependent variable, the Beige Book has predictive content for real GDP growth above and beyond the Blue Chip forecasts. This in some sense is quite surprising as the Blue Chip forecasts are explicitly a forecast of real GDP both current and next quarter while the Beige Book supposedly reflects only current economic activity. In fact, aside from the national summary score, adding the Blue Chip forecast to current quarter real GDP regressions that already include a Beige Book measure results in an increase in the adjusted R-squared of up to only eight percentage points. For next quarter real GDP the forward looking nature of the Blue Chip forecasts becomes more important, nonetheless, all the Beige Book

measures are still statistically significant.⁸

How does the Beige Book compare with other real-time variables? Table 6 presents the p-values for excluding the alternative Beige Book measures and other real-time variables from a regression for current and next quarter real GDP. Among the real-time variables examined are: four lags of real GDP growth, current and two lags of monthly industrial production growth, employment growth, and real retail sales (deflated by the CPI).⁹ For current and next quarter real GDP growth, all the Beige Book measures retain their predictive content when compared with four lags of real GDP growth. Lags of real GDP, on the other hand, are generally not significant at the five-percent level. When we add monthly real-time industrial production, real retail sales, and employment growth to the current quarter real GDP regression, all the Beige Book measures with the exception of the national summary continue to be statistically significant. On the other hand, among the real-time variables only industrial production is consistently statistically significant at the five-percent level. With respect to next quarter real GDP, the p-values for excluding the Beige Book measures are higher than in the current quarter regressions, with only the disaggregated regional summaries, the average of the sectoral summaries, and the disaggregated sectoral summaries being statistically significant at the five-percent level. However, the p-values for the Beige Book measures are generally lower than the other real-time variables. What these results suggest is that the Beige Book contains information about current

⁸ Note that these results do not necessarily imply that the Blue Chip forecasts are not efficient as the participants in the Blue Chip survey often would not have had access to the Beige Book information. Similarly, on most occasions the Beige Book summaries were compiled and written before the Blue Chip forecasts were released.

⁹ We also examined the case in which current and five lags of the monthly real time variables were used and the results were essentially the same. Generally, lags three through five were insignificant and were not included in our analysis.

and next quarter real GDP growth not completely reflected in commonly used real-time indicators of aggregate economic activity.

Out-of-Sample Performance

In terms of within sample prediction of real GDP growth, the Beige Book does quite well compared to other real-time variables. However, the relatively nonparsimonious specifications of at least the disaggregated regional and sectoral Beige Book summaries, to say nothing of the time series models, make one worry about *over-fitting the data*. As a result, in this section we present results from an out-of-sample forecasting experiment in which we calculate one-step-ahead forecasts starting in 1990, updating the forecasting equation each period.¹⁰ The root-mean-squared errors (RMSE) and the mean absolute errors (MAE) from these forecasts are presented in Table 7.¹¹

When considering the entire out-of-sample period, projections for current quarter real GDP based on the Beige Book indices do quite well. Four of the six forecasts based on the Beige Book have lower RMSE and MAE than the Blue Chip forecast and all six have lower RMSE and MAE than the projections derived from *real-time, time series models (lagged GDP and lagged GDP plus)*.¹² It turns out, however, that the relatively good performance is not uniform over the out-of-sample period. When we split the out-of-sample period in half, we find that over the

¹⁰ Following Koenig and Dolmas (1997), for the monthly real-time models we actually used a monthly forecasting model that has a different forecasting equation for each month of the quarter.

¹¹ This is not a true real-time, forecasting experiment, as the dependent variable is still real GDP growth after revisions. Our primary interest is in trying to evaluate the Beige Book as measuring economic activity rather than as forecaster of real GDP growth per se.

¹² In the forecasting experiment, we used the actual Blue Chip consensus forecast, rather than a regression projection.

forecast period starting in January 1990 through the first half of 1993 five of the six Beige Book projections do better than the Blue Chip forecast and all six do better than either time series projections. On the other hand, over the period starting in July 1993 through the end of 1996 only two Beige Book forecasts do better than the Blue Chip or the best real-time time series model (lagged GDP plus) in terms of RMSE and none do better in terms of MAE.

Table 8 presents tests of forecast encompassing over the two subperiods. Here we regress real GDP growth against a Beige Book forecast and the forecast of one of the competing models. Table 8 displays the marginal significance of each of the competing forecasts in the regression. For the current quarter GDP regression over the period January 1990 to June 1993, with the exception of the national summary and the average of regions indices, the Beige Book forecasts generally dominate those based on the Blue Chip and the time series models--none of the other forecasts are statistically significant while the Beige Book forecast is. Over the second half of the forecast period, the Beige Book forecasts in general do not dominate the Blue Chip forecast or the time series forecast that includes industrial production, real retail sales, and employment growth. For next quarter real GDP and regardless of the sample period, in most regressions neither the Beige Book forecast nor the competing forecast are statistically significant, suggesting no clear advantage of one forecasting model over the other. Thus, while the Beige Book has a clear advantage in the first half of the forecasting period this advantage does not continue over to the later period.

What accounts for the different performance across two subperiods? Figure 3 plots the forecast errors for the period 1990 through July 1993 from Beige Book forecast based on the average of sectoral scores, the Blue Chip forecast, and the time series forecast that includes

lagged real-time GDP growth, current and lagged industrial production, employment, and real retail sales growth. From the figure, the Beige Book forecast reflected the onset and end of the recession earlier than either the Blue Chip or the time series models. This suggests that the Beige Book, and maybe anecdotal evidence in general, may be most useful at turning points in the business cycle--periods in which more traditional economic indicators have historically had difficulty (Diebold and Rudebusch (1989)).

Conclusion

In this study, we attempted to quantify the qualitative information contained the Federal Reserve's Beige Book by assigning numerical scores to the descriptions of economic activity contained in the Beige Book document. We find that the quantified Beige Book descriptions do indeed reflect aggregate economic activity as measured by real GDP growth. Furthermore, Beige Book scores have information about economic activity above and beyond other variables such as the Blue Chip consensus forecast and other time series that would have been available to forecasters at the time. In particular, the Beige Book may be useful around turning points in the business cycle as these are notoriously hard to detect.

One should not infer from this study that we can dispense with traditional quantitative measures or formal forecasting models and rely on anecdotal evidence for assessing current economic activity--it was precisely because we quantified the Beige Book that we could begin to evaluate the information therein. However, in our judgement it would also be a mistake to infer that one could dispense with the verbal description in the Beige Book and rely solely on the quantified measures (either ours or others) of the Beige Book. As we mentioned above much of

the value added in the Beige Book may be the judgement of the analysts that write and compile the Beige Book rather than the raw information gathered in the Beige Book surveys. The act of giving a numerical value may restrict the degree to which this judgement can be communicated. Furthermore, the information in the Beige Book is multifaceted. We quantified and evaluated only one dimension of the Beige Book-- in terms of what it was telling us about current economic activity as measured by output growth. But one could just as easily read the Beige Book in terms of its description about inflation, financial market or credit conditions. This multifaceted information may be better communicated verbally rather than by a single numerical index. That said, by quantifying the Beige Book we have shown that in terms of providing information about current economic activity the Beige Book warrants serious reading.

Notes: ^a The Beige Book closing date was published before June 1987.

^b This refers to the month in which the data series was released. Typically, the employment report (for the previous month) is released the first Friday of the month, the Blue Chip consensus forecast is released around the tenth of the month, and the previous month's industrial production and retail sales are released mid-month.

^c GDP estimates were not released in this period due to the Federal Government shutdown.

RESEARCH PAPERS OF THE RESEARCH DEPARTMENT
FEDERAL RESERVE BANK OF DALLAS

Available, at no charge, from the Research Department
Federal Reserve Bank of Dallas, P. O. Box 655906
Dallas, Texas 75265-5906

Please check the titles of the Research Papers you would like to receive:

- 9201 Are Deep Recessions Followed by Strong Recoveries? (Mark A. Wynne and Nathan S. Balke)
- 9202 The Case of the "Missing M2" (John V. Duca)
- 9203 Immigrant Links to the Home Country: Implications for Trade, Welfare and Factor Rewards (David M. Gould)
- 9204 Does Aggregate Output Have a Unit Root? (Mark A. Wynne)
- 9205 Inflation and Its Variability: A Note (Kenneth M. Emery)
- 9206 Budget Constrained Frontier Measures of Fiscal Equality and Efficiency in Schooling (Shawna Grosskopf, Kathy Hayes, Lori L. Taylor, William Weber)
- 9207 The Effects of Credit Availability, Nonbank Competition, and Tax Reform on Bank Consumer Lending (John V. Duca and Bonnie Garrett)
- 9208 On the Future Erosion of the North American Free Trade Agreement (William C. Gruben)
- 9209 Threshold Cointegration (Nathan S. Balke and Thomas B. Fomby)
- 9210 Cointegration and Tests of a Classical Model of Inflation in Argentina, Bolivia, Brazil, Mexico, and Peru (Raul Anibal Feliz and John H. Welch)
- 9211 Nominal Feedback Rules for Monetary Policy: Some Comments (Evan F. Koenig)
- 9212 The Analysis of Fiscal Policy in Neoclassical Models¹ (Mark Wynne)
- 9213 Measuring the Value of School Quality (Lori Taylor)
- 9214 Forecasting Turning Points: Is a Two-State Characterization of the Business Cycle Appropriate? (Kenneth M. Emery & Evan F. Koenig)
- 9215 Energy Security: A Comparison of Protectionist Policies (Mine K. Yücel and Carol Dahl)
- 9216 An Analysis of the Impact of Two Fiscal Policies on the Behavior of a Dynamic Asset Market (Gregory W. Huffman)
- 9301 Human Capital Externalities, Trade, and Economic Growth (David Gould and Roy J. Ruffin)
- 9302 The New Face of Latin America: Financial Flows, Markets, and Institutions in the 1990s (John Welch)
- 9303 A General Two Sector Model of Endogenous Growth with Human and Physical Capital (Eric Bond, Ping Wang, and Chong K. Yip)
- 9304 The Political Economy of School Reform (S. Grosskopf, K. Hayes, L. Taylor, and W. Weber)
- 9305 Money, Output, and Income Velocity (Theodore Palivos and Ping Wang)
- 9306 Constructing an Alternative Measure of Changes in Reserve Requirement Ratios (Joseph H. Haslag and Scott E. Hein)
- 9307 Money Demand and Relative Prices During Episodes of Hyperinflation (Ellis W. Tallman and Ping Wang)
- 9308 On Quantity Theory Restrictions and the Signalling Value of the Money Multiplier (Joseph Haslag)
- 9309 The Algebra of Price Stability (Nathan S. Balke and Kenneth M. Emery)
- 9310 Does It Matter How Monetary Policy is Implemented? (Joseph H. Haslag and Scott Hein)
- 9311 Real Effects of Money and Welfare Costs of Inflation in an Endogenously Growing Economy with Transactions Costs (Ping Wang and Chong K. Yip)
- 9312 Borrowing Constraints, Household Debt, and Racial Discrimination in Loan Markets (John V. Duca and Stuart Rosenthal)
- 9313 Default Risk, Dollarization, and Currency Substitution in Mexico (William Gruben and John Welch)
- 9314 Technological Unemployment (W. Michael Cox)
- 9315 Output, Inflation, and Stabilization in a Small Open Economy: Evidence from Mexico (John H. Rogers and Ping Wang)
- 9316 Price Stabilization, Output Stabilization and Coordinated Monetary Policy Actions (Joseph H. Haslag)
- 9317 An Alternative Neo-Classical Growth Model with Closed-Form Decision Rules (Gregory W. Huffman)
- 9318 Why the Composite Index of Leading Indicators Doesn't Lead (Evan F. Koenig and Kenneth M. Emery)
- 9319 Allocative Inefficiency and Local Government: Evidence Rejecting the Tiebout Hypothesis (Lori L. Taylor)
- 9320 The Output Effects of Government Consumption: A Note (Mark A. Wynne)
- 9321 Should Bond Funds be Included in M2? (John V. Duca)

- ___ 9322 Recessions and Recoveries in Real Business Cycle Models: Do Real Business Cycle Models Generate Cyclical Behavior? (Mark A. Wynne)
- ___ 9323* Retaliation, Liberalization, and Trade Wars: The Political Economy of Nonstrategic Trade Policy (David M. Gould and Graeme L. Woodbridge)
- ___ 9324 A General Two-Sector Model of Endogenous Growth with Human and Physical Capital: Balanced Growth and Transitional Dynamics (Eric W. Bond, Ping Wang, and Chong K. Yip)
- ___ 9325 Growth and Equity with Endogenous Human Capital: Taiwan's Economic Miracle Revisited (Maw-Lin Lee, Ben-Chieh Liu, and Ping Wang)
- ___ 9326 Clearinghouse Banks and Banknote Over-issue (Scott Freeman)
- ___ 9327 Coal, Natural Gas and Oil Markets after World War II: What's Old, What's New? (Mine K. Yücel and Shengyi Guo)
- ___ 9328 On the Optimality of Interest-Bearing Reserves in Economies of Overlapping Generations (Scott Freeman and Joseph Haslag)
- ___ 9329* Retaliation, Liberalization, and Trade Wars: The Political Economy of Nonstrategic Trade Policy (David M. Gould and Graeme L. Woodbridge) (Reprint of 9323 in error)
- ___ 9330 On the Existence of Nonoptimal Equilibria in Dynamic Stochastic Economies (Jeremy Greenwood and Gregory W. Huffman)
- ___ 9331 The Credibility and Performance of Unilateral Target Zones: A Comparison of the Mexican and Chilean Cases (Raul A. Feliz and John H. Welch)
- ___ 9332 Endogenous Growth and International Trade (Roy J. Ruffin)
- ___ 9333 Wealth Effects, Heterogeneity and Dynamic Fiscal Policy (Zsolt Becsi)
- ___ 9334 The Inefficiency of Seigniorage from Required Reserves (Scott Freeman)
- ___ 9335 Problems of Testing Fiscal Solvency in High Inflation Economies: Evidence from Argentina, Brazil, and Mexico (John H. Welch)
- ___ 9336 Income Taxes as Reciprocal Tariffs (W. Michael Cox, David M. Gould, and Roy J. Ruffin)
- ___ 9337 Assessing the Economic Cost of Unilateral Oil Conservation (Stephen P.A. Brown and Hillard G. Huntington)
- ___ 9338 Exchange Rate Uncertainty and Economic Growth in Latin America (Darryl McLeod and John H. Welch)
- ___ 9339 Searching for a Stable M2-Demand Equation (Evan F. Koenig)
- ___ 9340 A Survey of Measurement Biases in Price Indexes (Mark A. Wynne and Fiona Sigalla)
- ___ 9341 Are Net Discount Rates Stationary?: Some Further Evidence (Joseph H. Haslag, Michael Nieswiadomy, and D. J. Slotje)
- ___ 9342 On the Fluctuations Induced by Majority Voting (Gregory W. Huffman)
- ___ 9401 Adding Bond Funds to M2 in the P-Star Model of Inflation (Zsolt Becsi and John Duca)
- ___ 9402 Capacity Utilization and the Evolution of Manufacturing Output: A Closer Look at the "Bounce-Back Effect" (Evan F. Koenig)
- ___ 9403 The Disappearing January Blip and Other State Employment Mysteries (Frank Berger and Keith R. Phillips)
- ___ 9404 Energy Policy: Does it Achieve its Intended Goals? (Mine Yücel and Shengyi Guo)
- ___ 9405 Protecting Social Interest in Free Invention (Stephen P.A. Brown and William C. Gruben)
- ___ 9406 The Dynamics of Recoveries (Nathan S. Balke and Mark A. Wynne)
- ___ 9407 Fiscal Policy in More General Equilibrium (Jim Dolmas and Mark Wynne)
- ___ 9408 On the Political Economy of School Deregulation (Shawna Grosskopf, Kathy Hayes, Lori Taylor, and William Weber)
- ___ 9409 The Role of Intellectual Property Rights in Economic Growth (David M. Gould and William C. Gruben)
- ___ 9410 U.S. Banks, Competition, and the Mexican Banking System: How Much Will NAFTA Matter? (William C. Gruben, John H. Welch and Jeffery W. Gunther)
- ___ 9411 Monetary Base Rules: The Currency Caveat (R. W. Hafer, Joseph H. Haslag, and Scott E. Hein)
- ___ 9412 The Information Content of the Paper-Bill Spread (Kenneth M. Emery)
- ___ 9413 The Role of Tax Policy in the Boom/Bust Cycle of the Texas Construction Sector (D'Ann Petersen, Keith Phillips and Mine Yücel)
- ___ 9414 The P* Model of Inflation, Revisited (Evan F. Koenig)
- ___ 9415 The Effects of Monetary Policy in a Model with Reserve Requirements (Joseph H. Haslag)
- ___ 9501 An Equilibrium Analysis of Central Bank Independence and Inflation (Gregory W. Huffman)
- ___ 9502 Inflation and Intermediation in a Model with Endogenous Growth (Joseph H. Haslag)
- ___ 9503 Country-Bashing Tariffs: Do Bilateral Trade Deficits Matter? (W. Michael Cox and Roy J. Ruffin)
- ___ 9504 Building a Regional Forecasting Model Utilizing Long-Term Relationships and Short-Term Indicators

(Keith R. Phillips and Chih-Ping Chang)

- ___ 9505 Building Trade Barriers and Knocking Them Down: The Political Economy of Unilateral Trade Liberalizations (David M. Gould and Graeme L. Woodbridge)
- ___ 9506 On Competition and School Efficiency (Shawna Grosskopf, Kathy Hayes, Lori L. Taylor and William L. Weber)
- ___ 9507 Alternative Methods of Corporate Control in Commercial Banks (Stephen Prowse)
- ___ 9508 The Role of Intra-temporal Adjustment Costs in a Multi-Sector Economy (Gregory W. Huffman and Mark A. Wynne)
- ___ 9509 Are Deep Recessions Followed By Strong Recoveries? Results for the G-7 Countries (Nathan S. Balke and Mark A. Wynne)
- ___ 9510 Oil Prices and Inflation (Stephen P.A. Brown, David B. Oppedahl and Mine K. Yücel)
- ___ 9511 A Comparison of Alternative Monetary Environments (Joseph H. Haslag)
- ___ 9512 Regulatory Changes and Housing Coefficients (John V. Duca)
- ___ 9513 The Interest Sensitivity of GDP and Accurate Reg Q Measures (John V. Duca)
- ___ 9514 Credit Availability, Bank Consumer Lending, and Consumer Durables (John V. Duca and Bonnie Garrett)
- ___ 9515 Monetary Policy, Banking, and Growth (Joseph H. Haslag)
- ___ 9516 The Stock Market and Monetary Policy: The Role of Macroeconomic States (Chih-Ping Chang and Huan Zhang)
- ___ 9517 Hyperinflations and Moral Hazard in the Appropriation of Seigniorage: An Empirical Implementation With A Calibration Approach (Carlos E. Zarazaga)
- ___ 9518 Targeting Nominal Income: A Closer Look (Evan F. Koenig)
- ___ 9519 Credit and Economic Activity: Shocks or Propagation Mechanism? (Nathan S. Balke and Chih-Ping Chang)
- ___ 9601 The Monetary Policy Effects on Seigniorage Revenue in a Simple Growth Model (Joseph H. Haslag)
- ___ 9602 Regional Productivity and Efficiency in the U.S.: Effects of Business Cycles and Public Capital (Dale Boisso, Shawna Grosskopf and Kathy Hayes)
- ___ 9603 Inflation, Unemployment, and Duration (John V. Duca)
- ___ 9604 The Response of Local Governments to Reagan-Bush Fiscal Federalism (D. Boisso, Shawna Grosskopf and Kathy Hayes)
- ___ 9605 Endogenous Tax Determination and the Distribution of Wealth (Gregory W. Huffman)
- ___ 9606 An Exploration into the Effects of Dynamic Economic Stabilization (Jim Dolmas and Gregory W. Huffman)
- ___ 9607 Is Airline Price Dispersion the Result of Careful Planning or Competitive Forces? (Kathy J. Hayes and Leola B. Ross)
- ___ 9608 Some Implications of Increased Cooperation in World Oil Conservation (Stephen P.A. Brown and Hillard G. Huntington)
- ___ 9609 An Equilibrium Analysis of Relative Price Changes and Aggregate Inflation (Nathan S. Balke and Mark A. Wynne)
- ___ 9610 What's Good for GM...? Using Auto Industry Stock Returns to Forecast Business Cycles and Test the Q-Theory of Investment (Gregory R. Duffee and Stephen Prowse)
- ___ 9611 Does the Choice of Nominal Anchor Matter? (David M. Gould)
- ___ 9612 The Policy Sensitivity of Industries and Regions (Lori L. Taylor and Mine K. Yücel)
- ___ 9613 Oil Prices and Aggregate Economic Activity: A Study of Eight OECD Countries (Stephen P.A. Brown, David B. Oppedahl and Mine K. Yücel)
- ___ 9614 The Effect of the Minimum Wage on Hours of Work (Madeline Zavodny)
- ___ 9615 Aggregate Price Adjustment: The Fischerian Alternative (Evan F. Koenig)
- ___ 9701 Nonlinear Dynamics and Covered Interest Rate Parity (Nathan S. Balke and Mark E. Wohar)
- ___ 9702 More on Optimal Denominations for Coins and Currency (Mark A. Wynne)
- ___ 9703 Specialization and the Effects of Transactions Costs on Equilibrium Exchange (James Dolmas and Joseph H. Haslag)
- ___ 9704 The Political Economy of Endogenous Taxation and Redistribution (Jim Dolmas and Gregory W. Huffman)
- ___ 9705 Inequality, Inflation, and Central Bank Independence (Jim Dolmas, Gregory W. Huffman, and Mark A. Wynne)
- ___ 9706 On The Political Economy of Immigration (Jim Dolmas and Gregory W. Huffman)
- ___ 9707 Business Cycles Under Monetary Union: EU and US Business Cycles Compared (Mark A. Wynne and Jahyeong Koo)

- ___ 9708 Allocative Inefficiency and School Competition (Shawna Grosskopf, Kathy Hayes, Lori L. Taylor and William L. Weber)
- ___ 9709 Goods-Market Competition and Profit Sharing: A Multisector Macro Approach (John V. Duca and David D. VanHoose)
- ___ 9710 Real-Time GDP Growth Forecasts (Evan F. Koenig and Sheila Dolmas)
- ___ 9711 Quasi-Specific Factors: Worker Comparative Advantage in the Two-Sector Production Model (Roy J. Ruffin)
- ___ 9712 Decomposition of Feedback Between Time Series in a Bivariate Error-Correction Model (Jahyeong Koo and Paul A. Johnson)
- ___ 9713 Measuring Regional Cost of Living (Jahyeong Koo, Keith Phillips and Fiona Sigalla)
- ___ 9801 Revenue-Maximizing Monetary Policy (Joseph H. Haslag and Eric R. Young)
- ___ 9802 How Well Does the Beige Book Reflect Economic Activity? Evaluating Qualitative Information Quantitatively (Nathan S. Balke and D'Ann Petersen)

Research Papers Presented at the
1994 Texas Conference on Monetary Economics
April 23-24, 1994
held at the Federal Reserve Bank of Dallas, Dallas, Texas

Available, at no charge, from the Research Department
Federal Reserve Bank of Dallas, P. O. Box 655906
Dallas, Texas 75265-5906

Please check the titles of the Research Papers you would like to receive:

- 1 A Sticky-Price Manifesto (Laurence Ball and N. Gregory Mankiw)
- 2 Sequential Markets and the Suboptimality of the Friedman Rule (Stephen D. Williamson)
- 3 Sources of Real Exchange Rate Fluctuations: How Important Are Nominal Shocks? (Richard Clarida and Jordi Gali)
- 4 On Leading Indicators: Getting It Straight (Mark A. Thoma and Jo Anna Gray)
- 5 The Effects of Monetary Policy Shocks: Evidence From the Flow of Funds (Lawrence J. Christiano, Martin Eichenbaum and Charles Evans)
