Summary

coordinated ligand А terminally CO in the complexes $[Fe_2{\mu-CN(Me)R}(\mu-$ CO)(CO)₂(Cp)₂][SO_3CF_3] (R = Me, 1a; R = Xyl, 1b; Xyl = 2,6-Me_2C_6H_3), is readily displaced by primary and secondary amines (L), in the presence of Me₃NO, affording the complexes $[Fe_2 \{\mu$ - $CN(Me)R{(\mu-CO)(CO)(L)(Cp)_2}[SO_3CF_3] (R = Me, L = NH_2Et, 4a; R = Xyl, L = NH_2Et, 4b; R =$ Me, $L = NH_2Pr^i$, **5a**; R = Xyl, $L = NH_2Pr^i$, **5b**; R = Xyl, $L = NH_2C_6H_{11}$, **6**; R = Xyl, $L = NH_2Ph$, **7**; $R = Xyl, L = NH_3, B; R = Me, L = NHMe_2, 9a; R = Xyl, L = NHMe_2, 9b; R = Xyl, L = NH(CH_2)_5,$ 10). In the absence of Me₃NO, NH₂Et gives addition at the CO ligand of 1b, yielding $[Fe_2 \{\mu$ -CN(Me)(Xyl){(μ -CO)(CO){C(O)NHEt}(Cp)₂] (11). Carbonyl replacement is also observed in the reaction of **1a-b** with pyridine and benzophenone imine, affording $[Fe_2\{\mu-CN(Me)R\}(\mu-K)]$ $CO)(CO)(L)(Cp)_2[SO_3CF_3]$ (R= Me, L= Py, 12a; R = Xyl, L= Py, 12b; R= Me, L= HN=CPh_2, 12b; R= Me, R= HN=CPh_2, 12b; R= Me, R= Me, R= Me, R= HN=CPh_2, 12b; R= HN 13a; R = Xyl, L= HN=CPh₂, 13b). The imino complex 13b reacts with p-tolylacetylide leading to µ-vinylidene-diaminocarbene compound $[Fe_{2}\{u-n^{1}:n^{2}$ the formation of the $C=C(Tol)C(Ph)_2N(H)CN(Me)(Xyl)\}(\mu-CO)(CO)(Cp_2)$ (15) which has been studied by X-ray diffraction.

Keywords: amine, imine, diaminocarbene, vinylidene, diiron complexes, crystal structure Corresponding author e-mail address: valerio.zanotti@unibo.it

1. Introduction

Diiron bridging aminocarbyne complexes $[Fe_2\{\mu-CN(Me)R\}(\mu-CO)(CO)_2(Cp)_2][SO_3CF_3]$ (R = Me, 1a; R = Xyl, 1b; Xyl = 2,6-Me_2C_6H_3) and $[Fe_2(\mu-CNMe_2)_2(CO)_2(Cp)_2][SO_3CF_3]_2$ (2) exhibit a remarkable electrophilic character. It has been shown that carbon nucleophiles (R⁻) react with **1** to give [Fe₂{ μ -CN(Me)R}(μ -CO)(CO)(COR')(Cp)₂] or [Fe₂{ μ -CN(Me)R}(μ -CO)(CO)₂(η^4 -C₅H₅R')(Cp)] *via* selective addition at the carbonyl (organo-cuprates, acetylides) and cyclopentadienyl ligand (organo-lithium or Grignard reagents), respectively [1]. On the other hand, weaker nucleophiles, including isocyanides, CN⁻, nitriles, halides and phosphines react with **1** and **2**, giving CO replacement, under thermal, photolytic or chemical activation [2]. Reactions involving the bridging aminocarbyne ligand of **1** have been limited to the addition of hydride (from NaBH₄) and cyanide (from NBu₄CN), affording the corresponding aminocarbene complexes [3]. More recently, we have reported on the insertion of alkynes (R'CCR") into the metal–carbyne carbon bond of the acetonitrile complexes [Fe₂{ μ -CN(Me)R}(μ -CO)(CO)(NCMe)(Cp)₂][SO₃CF₃] (R = Me, **3a**; Xyl, **3b**; CH₂Ph, **3c**), which leads to the formation of bridging vinyliminium complexes [Fe₂{ μ - σ : η^3 -C(R')=C(R")C=N(Me)(R){(μ -CO)(CO)(CD)₂][SO₃CF₃] (R' = Me, COOMe, SiMe₃, Ph, Tol; R''= H, Me, Et, Ph) via coupling of the alkyne and aminocarbyne ligand [4].

Reactions of the diiron μ -aminocarbyne complexes with amines have been scarcely investigated. It has been shown that **2** undergoes addition of HNR'₂ at the CO yielding the carbamoyl complexes [Fe₂(μ -CNMe₂)₂(μ -CO){C(O)NR'}(Cp)₂][SO₃CF₃]. Primary amines generate carbamoyl intermediates which further react, by dehydration, giving isocyanide derivatives [2b].

On the light of a renewed interest towards nitrogen-containing ligands, mainly due to applications in the field of catalysis [5], we have been interested at determining whether nitrogen ligands, including amines and imines, could be coordinated to the Fe atom in the aminocarbyne complexes **1a-b** and **3a-b**, and at investigating their chemistry. Our findings are the matter of this paper.

2. Results and discussion

2.1. Reactions with amines

The reactions of compounds **1a-b**, in tetrahydrofurane solution, at room temperature, with an excess of ethylamine in the presence of Me₃NO, result in the formation of the amino complexes $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)(NH_2Et)(Cp)_2][SO_3CF_3](R= Me,$ **4a**; R = Xyl,**4b**) (scheme 1),which have been isolated in about 65-70% yields after filtration on alumina. Other amines,including secondary amines and ammonia, but not tertiary amines (NMe₃, NEt₃), react analogously $affording the complexes [Fe₂{<math>\mu-CN(Me)R$ }($\mu-CO$)(CO)(NHR'R")(Cp)₂][SO₃CF₃] (**5-10**) in comparable yields (Scheme 1).

R OC Fe	Me + K	Me_3NC $- CO_2$	R" C	$ \begin{array}{c} R \\ OC \\ Fe \\ C \\ O \\ O \end{array} $	Me + NHR'R" Fe

Complexes **4-10** have been characterized by IR and NMR spectroscopy and elemental analysis. Moreover, the structure of **4a** has been ascertained by an X-ray diffraction experiment; its molecular structure is reported in Figure 1, whereas the main bond lengths and bond angles are reported in Table 1.

Figure 1

Molecular structure of **4a**, with key atoms labelled (all H atoms, apart from H2b and H2c, have been omitted). Displacement ellipsoids are at 30% probability level. Only the main images of the disordered Cp ligands are drawn.

Table 1

Selected bond lengths (Å) and angles (°) for complex 4a.

The Cp ligands in **4a** adopt a *cis* geometry relative to the mean plane determined by the $Fe_2(\mu-C)_2$ core, as previously reported for analogous diiron complexes containing a bridging

aminocarbyne ligand [1, 2, 6]. The C(12)-N(1) interaction [1.305(15)Å] exhibits a considerably double bond character, suggesting that the μ -aminocarbyne ligand can be alternatively described as a μ -iminium ligand; in agreement with this, both N(1) and C(12) show an almost perfect sp² hybridisation [sum angles 360.0(22) and 359.7(6)°, respectively]. The Fe(2)-N(2) interaction [2.023(8)Å] indicates a pure σ -bond, as expected for a coordinated amine ligand. The compound **4a** exists in the solid state as {[Fe₂{ μ -CNMe₂}(μ -CO)(CO)(NH₂Et)(Cp)₂][SO₃CF₃]}₂ dimers, because of the presence of hydrogen bonds between the two NH₂ protons of the cations and two different CF₃SO₃⁻ anions (Figure 2). Thus, each triflate anion acts as a bridging hydrogen bond acceptor between two distinct [Fe₂{ μ -CNMe₂}(μ -CO)(CO)(NH₂Et)(Cp)₂]⁺ cations, *via* two of its three oxygen atoms.

Figure 2

 $\begin{aligned} \text{Representation of the hydrogen bonded } \{ [Fe_2 \{ \mu - \text{CNMe}_2 \} (\mu - \text{CO})(\text{CO})(\text{NH}_2\text{Et})(\text{Cp})_2] [SO_3\text{CF}_3] \}_2 \\ \text{dimers in } \textbf{4a} [\textbf{CF}_3\textbf{SO}_3]. \ \text{N}(2) \dots \text{O}(20) \ 3.098(14) \ \text{\AA}, \ \text{N}(2) \dots \text{O}(10^{\circ}) \ 3.001(12) \ \text{\AA}. \end{aligned}$

The IR spectra of compounds **4-10**, in CH_2Cl_2 solution, exhibit the usual v-CO band pattern, consisting in one terminal and one bridging absorption (e.g. for **4a** at 1969 and 1800 cm⁻¹). The ¹H and ¹³C NMR spectra of the complex **4a** show two signals of the same intensity for the non-

equivalent N-bonded methyl groups (at 4.68, 4.25 and 54.0, 52.5 ppm, respectively) and indicate the presence of a single isomer. The two N-bonded hydrogens of the NH₂Et ligand are also nonequivalent and originate two high field shifted broad multiplets (at 2.45 and -2.76 ppm). The spectra of **4b**, **5b**, **6-8**, **9b** and **10**, which contain the asymmetrically substituted μ -CN(Me)(Xyl), show the presence of minor amounts of a second isomeric form, as usually found in complexes of the type [Fe₂{ μ -CN(Me)(Xyl)}(μ -CO)(CO)(L)(Cp)₂]⁺ (L = CNR, NCR, PR₃) and [Fe₂{ μ -CN(Me)(Xyl)}(μ -CO)(CO)(L)(Cp)₂] (L = C(O)R, CH₂CN, CN, Cl) [1, 2]. This is due to the different orientations that Me and Xyl groups can assume with respect to the non-equivalent Fe atoms, and are consequence of the double bond character of the μ -C=N interaction, which do not allow inter-conversion of the isomers *via* rotation around the C–N bond (Figure 3).

Figure 3 Isomers due to the different orientations of the amino carbyne substituents.

Characteristic feature in the 13 C NMR spectra of all the complexes **4-10** is the low field resonance of the bridging carbyne carbon (in the 335-340 ppm range).

It is worth noting that the syntheses above described take place only in the presence of Me₃NO; otherwise, the amine attack occurs at the terminally coordinated CO, in a way similar to that reported for the reactions of $[Fe_2(\mu-CNMe_2)_2(CO)_2(Cp)_2][SO_3CF_3]_2$ (2) with NH₂R [2b]. For example, the reaction of $[Fe_2{\mu-CN(Me)(Xyl)}(\mu-CO)(CO)_2)(Cp)_2][SO_3CF_3]$ (1b) with a large excess of NH₂Et, generates the complex $[Fe_2{\mu-CN(Me)(Xyl)}(\mu-CO)(CO){CO}(CO){CO})_{CO}(CO){CO}(CO){CO})_{CO}(CO){CO}(CO){CO}(CO){CO})_{CO}(CO){CO}(CO){CO}(CO){CO})_{CO}(CO){CO}(CO){CO}(CO){CO})_{CO}(CO){CO})_{CO}(CO){CO}(CO){CO})_{CO}(CO)$

Scheme 2

Complex **11** has been characterized by NMR and IR spectroscopy (see experimental part). The presence of the C(O)NHEt ligand is supported by the observed ¹H NMR broad resonance at 5.74 ppm, attributable to the N-H, and by the ¹³C NMR signal at 202.9 ppm due to the carboxamido carbon.

Since complexes **4-10** have been obtained from **1a-b** *via* CO displacement, their syntheses could be alternatively accomplished by removal of the labile MeCN from $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)(NCMe)(Cp)_2][SO_3CF_3]$ (R = Me, **3a**; Xyl, **3b**). However, it should be considered that coordinated nitriles are also susceptible of nucleophilic addition by amines, with formation of metal amidinates [8]. In order to determine which of the two possibilities (addition *vs.* substitution) prevails, **3b** has been treated with amines (NH₂Prⁱ, NH₂Ph). Our findings show that the reactions proceed with replacement of the nitrile ligand; thus the observed products are the amine complexes **5b** and **7**, respectively, obtained in comparable yields with respect to the synthesis reported in Scheme 1, and no addition at the coordinated MeCN has been revealed to any extent.

2.2. Reactions with pyridine and benzophenone imine

Replacement of CO from **1a-b**, in the presence of Me₃NO, has been accomplished also by pyridine (Py = NC₅H₅), and benzophenone imine (HN=CPh₂). The reactions lead to the formation of [Fe₂{ μ -CN(Me)R}(μ -CO)(CO)(L)(Cp)₂][SO₃CF₃] (R= Me, L= Py, **12a**; R = Xyl, L= Py **12b**; R= Me, L= HN=CPh₂, **13a**; R = Xyl, L= HN=CPh₂, **13b**) (Scheme 3). Compounds **12** and **13** exhibit spectroscopic properties similar to those of **4-10**. Imine coordination in **13a-b** is revealed by the IR absorption v(N-H) at 3314 cm⁻¹ (in KBr pellets), and the ¹H NMR resonance at *ca*. 6.1-6.3 ppm. Major features of the ¹³C NMR spectrum of **13a-b** include the expected low-field resonance of the μ -aminocarbyne carbon, and the resonance attributable to the imine carbon at about 191 ppm.

The above described reactions indicate that replacement of the coordinated CO or NCMe by amines are the favourite routes, and that the μ -aminocarbyne ligand remains unaffected. This result is not obvious, because other related cationic diiron complexes of the type [Fe₂{ μ -C(SMe₂)CN}(μ -CO)(CO)₂)(Cp)₂]⁺ [3], [Fe₂(μ -CAr)(η ⁸-C₈H₈)(CO)₄)]⁺ [9] and [Fe₂(μ -CH)(μ -CO)(CO)₂)(Cp)₂]⁺ [10] have been shown to react with amines at the bridging carbene or carbyne carbon, rather than involving the terminally coordinated CO.

2.3. Reactions of the coordinated amine and imine ligands

Deprotonation of coordinated primary or secondary amines represents a possible route to the synthesis of amide complexes [11], thus the compounds **5a-b** and **6** containing NH_2Pr^i and $NH_2C_6H_{11}$, respectively, have been treated with NaH or BuLi with the aim of obtaining the corresponding amide complexes. Unexpectedly, the known bridging hydride complexes [Fe₂{ μ -CN(Me)(R)}(μ -H)(CO)₂(Cp)₂] (R = Me, **14a**; R= Xyl, **14b**) [2c] have been formed (Scheme 4). The reaction resembles that described for the mononuclear complex [CpRu(HNMe₂)(PPh₃)₂]⁺, in which deprotonation of the coordinated amine was followed by β -hydrogen elimination from the N-Me, leading to the formation of the hydride complex [CpRu(H)(PPh₃)₂], with release of MeN=CH₂ [11b]. A difference consists in the fact that in **14**, the hydride ligand is bridging instead of

terminally coordinated. This is in accordance with the preference of H⁻ for the bridging coordination and with the exchange that easily occurs between bridging and terminal coordination positions within the Fe₂(CO)₂Cp₂ frame. Support to the above assumptions comes by observing that compound 7, in which the aniline ligand can not undergo β -hydrogen transfer, does not form the hydride complex 14, under the same reaction conditions.

Scheme 4

Stable azavynilidene complexes can be generated by deprotonation of coordinated imines [12]. However, we have recently reported that the azavinylidene complex $[Fe_2{\mu-CN(Me)(Xyl)}(\mu-$ CO(CO){NC(C=CTol)Bu^t}(Cp)₂] is unstable and undergoes an intramolecular rearrangement, with coupling of the azavinylidene with the aminocarbyne ligands [13]. The reaction ultimately led to the $Fe_{2}{\mu-\eta^{1}:\eta^{3}-}$ formation of complex the µ-allenyl-diaminocarbene $C(Tol)=C=C(CMe_3)N(H)CN(Me)(Xyl){(\mu-CO)(CO)(Cp_2)}[SO_3CF_3]$. In the light of these observations, we have investigated the reactions of 13a-b with NaH, in order to obtain the deprotonation of the imine ligand and possibly promote further rearrangements and C-N bond formation. Unfortunately, these attempts failed to produce any stable product. However, we have found that the coordinated imine can be attacked by acetilydes. In fact, addition of TolC=CLi (2.5-3 equivalents) to a THF solution of 13b, at low temperature, results, after work up, in the new neutral complex $[Fe_2\{\mu-\eta^1:\eta^2-C=C(Tol)C(Ph)_2N(H)CN(Me)(Xyl)\}(\mu-CO)(CO)(Cp_2)]$ (15), obtained in moderate yields (52 %) (Scheme 5). The nature of 15 has been fully elucidated by X-ray and the molecular structure is reported in Figure 4, whereas relevant bond lengths and angles are reported in Table 2.

Table 2

Selected bond lengths (Å) and angles (°) for complex 15.

The molecule contains a novel $\eta^1:\eta^2$ vinylidene-diaminocarbene ligand [*i.e.* μ - $\eta^1:\eta^2$ - $C=C(Tol)C(Ph)_2N(H)CN(Me)(Xyl)]$ coordinated to a $Fe_2(\mu-CO)(CO)(Cp_2)$ core. The latter shows the usual cis arrangement of the Cp ligands, and the Fe-Fe distance [2.5353(9) Å] is typical for a single bond. The bridging CO ligand presents a significant asymmetry [Fe(1)-C(11), 1.842(4) Å; Fe(2)-C(11), 2.002(4) Å], which is probably due to the different electronic environment of the two iron atoms. In particular, Fe(1) results to be electron richer than Fe(2), because the former is bound to a σ -donating diaminocarbene ligand, whereas the latter is attached to a π -acidic CO ligand. The bridging μ - η^1 : η^2 -C=C(Tol)C(Ph)_2N(H)CN(Me)(Xyl) ligand contains two distinct groups; *i.e.* the bridging vinylidene and a terminal diaminocarbene, linked by a saturated CPh₂ group. The bridging vinylidene μ -C=C is bound almost symmetrically to the iron atoms and the C(13)-C(14) distance [1.341(4) Å] is typical for bridging vinylidenes [14]. Despite the remarkable differences between N(1) and N(2) (i.e. different substituents, one is endo-cyclic the other exo-cyclic), the distances C(35)-N(1) [1.353(4) Å] and C(35)-N(2) [1.355(4) Å] are almost identical and show partial double bond character, suggesting electron donation from the two nitrogen atoms to the central carbon. As a consequence, all three atoms show a nearly perfect sp^2 ibridisation [sum angles 359.5(4), 360(3) and 360.0(5)° at C(35), N(1) and N(2), respectively] and the diaminocarbene unit is almost planar [N(1)-C(35)-N(2)-Fe(1) torsion angle $-171.84(47)^{\circ}]$. Fe(1) can also be viewed as part of a six membered ring constituted by Fe(1), C(35), N(1), C(22), C(14) and C(13) which can be described as a 1-metalla-3-aza-1,5-hexadiene with a boat conformation.

The IR spectrum of **15**, in CH₂Cl₂, shows two bands at 1934vs and 1734s cm⁻¹, attributable to the terminal and bridging CO ligands, respectively, These bands are strongly shifted toward lower frequencies compared to the starting complex **13b** (1978vs and 1813s cm⁻¹), as a direct consequence of the different charge of the two complexes. The main features of the ¹H NMR spectrum of **15** in CD₂Cl₂ are the presence of two distinct resonances for the inequivalent Cp ligands and a broad resonance at 8.87 ppm due to the NH group. The bridging vinylidene ligand μ -C_{α}=C_{β} shows two resonances in the ¹³C NMR spectrum at 286-280 ppm (C_{α}) and 149-141 ppm (C_{β}), which are typical regions for this class of ligands [14]. The resonance due to C_{α} falls in the high frequencies region of the spectrum, very close to the one due to μ -CO, whereas C_{β} resonates in the same region of the quaternary carbons of the aromatic rings (see experimental for further details). Two other resonances are present at relatively high frequencies, *i.e.* 220.5 and 216.3 ppm attributable to the diaminocarbene carbon and the terminal CO, respectively. Finally, the ESI MS spectrum of **15** in CH₃CN shows the presence of a positive ion at *m*/*z* = 740, due to ionisation of **15**.

Unfortunately, the reaction reported in Scheme 5 is not of general character. Thus, addition of TolC=CLi to a THF solution of $[Fe_2{\mu-CN(Me)_2}(\mu-CO)(CO)(Ph_2C=NH)(Cp)_2][SO_3CF_3]$ (13a) failed to produce any identifiable product. Also changing the acetylide reagent has a dramatic effect on the reaction. Therefore, the reaction of PhC=CLi with 13b led to the formation of the $\eta^1:\eta^2$ vinylidene-diaminocarbene $[Fe_2{\mu-\eta^1:\eta^2-C=C(Ph)C(Ph)_2N(H)CN(Me)(Xyl)}(\mu-CO)(CO)(Cp_2)]$ (16), in lower yields (31%), whereas the corresponding reaction with CH₃(CH₂)₃C=CLi resulted in a mixture of decomposition products.

The formation of **15** is worth some more comments. The bridging vinylidene-diaminocarbene ligand μ - η^1 : η^2 -C=C(Tol)C(Ph)₂N(H)CN(Me)(Xyl) is clearly the result of the coupling between the μ -aminocarbyne, the benzophenone imine ligand and the tolylacetylide, however, the mechanism of formation is not obvious and presumably requires several steps. New C-N and C-C bonds [C(35)-N(1) and C(14)-C(22) in Figure 4] are formed as a consequence of these couplings. Interestingly, the new C-C bond is generated between the imine carbon and the C_β carbon of TolC_β=C_αLi, and not with C_α, as it would be expected if the reaction was simply the nucleophilic addition of the tolylacetylide to the coordinated imine ligand. Therefore, we assume that the first step of the reaction consists in the deprotonation of the coordinated imine by the acetylide to give the η^1 -azavinylidene intermediate [Fe₂{ μ -CN(Me)(Xyl)}(μ -CO)(CO)(Ph₂C=N)(Cp)₂] (Scheme 6). Migration of the azavinylidene to the bridging carbyne accounts for the observed C-N bond formation and is in agreement with a similar rearrangement observed in [Fe₂{ μ -CN(Me)(Xyl)}(μ -CO)(CO){NC(C=CT0)Bu^t}(Cp)₂] [13] and with the existence of species like [Fe₂{ μ -CN

 $CH(NCPh_2)$ (μ -CO)(CO)(Cp)₂ [10]. As a consequence of the migration, an unsaturation is formed on one iron and this can be occupied by an acetylide ligand. This hypothesis would explain why the stoichiometry of the reaction requires, at least, 2 moles of acetylide per mole of compound 13a, in order to obtain good yields. The acetylide ligand, σ -coordinated, could be directly available for coupling with the imine carbon group or, alternatively, could be transformed, after protonation, into a bridging vinylidene ligand. Several examples describe the transformation of alkynes into µcomplexes vinylidenes dinuclear [15]. in In both cases, coupling with $\{\mu - C[N(Me)(Xyl)][NC(Ph)_2]\}$ necessarily involves the C_{β} carbon of the acetilyde in order to explain the observed C-C bond formation (Scheme 6).

This hypothesis, far from providing any exhaustive interpretation of the mechanism leading to the novel vinylidene-diaminocarbene **15**, simply underlines the complexity of the reaction, which further emphasizes the attitude of dinuclear aminocarbyne complexes in promoting C-C and C-N bond formation [1, 4, 13, 16].

3. Experimental details

3.1. General

All reactions were carried out routinely under nitrogen using standard Schlenk techniques. Solvents were distilled immediately before use under nitrogen from appropriate drying agents. Glassware was oven-dried before use. Infrared spectra were recorded on a Perkin-Elmer Spectrum 2000 FT-IR spectrophotometer and elemental analyses were performed on a ThermoQuest Flash 1112 Series EA Instrument. ESI MS spectra were recorded on a Waters Micromass ZQ 4000 with samples dissolved in CH₃CN. All NMR measurements were performed on Varian Gemini 300 and Varian Mercury 400 instruments. The chemical shifts for ¹H and ¹³C were referenced to internal TMS. The spectra were fully assigned via DEPT experiments and ¹H,¹³C correlation through gs-HSQC and gs-HMBC experiments [17]. Unless otherwise stated, NMR signals due to trace amounts of second isomeric form are italicised. All the reagents were commercial products (Aldrich) of the highest purity available and used as received. $[Fe_2(CO)_4(Cp)_2]$ was from Strem and used as received. Compounds $[Fe_2 {\mu-CN(Me)R}(\mu-CO)(CO)_2(Cp)_2][SO_3CF_3]$ (R = Me, **1a**; Xyl, **1b**) and $[Fe_2 {\mu-CN(Me)R}(\mu-CO)(CD)_2][SO_3CF_3]$ (R = Me, **3a**; Xyl, **3b**) were prepared as described in the literature. [2a, 2c, 18]

3.2. Synthesis of $[Fe_2(\mu-CNMe_2)(\mu-CO)(CO)(NH_2Et)(Cp)_2][SO_3CF_3]$ (4a) and $[Fe_2\{\mu-CN(Me)(Xyl)\}(\mu-CO)(CO)(NH_2Et)(Cp)_2][SO_3CF_3]$ (4b)

Gaseous NH₂Et was bubbled into a stirred solution of $[Fe_2(\mu-CN(Me_2))(\mu-CO)(CO)_2(Cp)_2][SO_3CF_3]$ (**1a**) (160 mg, 0.30 mmol) in THF (15 ml) containing Me₃NO (39 mg, 0.51 mmol). The mixture was stirred for 40 min and, then, the volatile material was removed *in vacuo*. Chromatography of the residue on an alumina column, with MeCN as eluent, gave **4a**, which was crystallized from CH₂Cl₂-Et₂O mixture (v/v ratio 1/1). Yield 104 mg (63%). Found: C, 39.66; H, 4.26, N 5.28%. C₁₈H₂₃F₃Fe₂N₂O₅S requires: C, 39.44; H, 4.23, N, 5.11%. IR (CH₂Cl₂) v_{max}(cm⁻¹) 1969vs and 1800s (CO). ¹H NMR (CDCl₃) δ 4.88, 4.83 (s, 10H, Cp); 4.68, 4.25 (s, 6H, NMe₂); 2.45 (br, 1H, NH₂); 2.08 (q, 2H, ³J_{HH}=7Hz, N-CH₂-CH₃); 0.75 (t, 3H, ³J_{HH}=7Hz, N-CH₂-CH₃); -2.76 (br, 1H, NH₂). ¹³C NMR (CDCl₃) δ 331.3 (μ -C); 268.8 (μ -CO); 212.9 (CO); 88.1, 86.5 (Cp); 54.0, 52.5 (NMe₂); 43.6 (N-CH₂-CH₃); 17.2 (N-CH₂-CH₃).

Compound **4b** was obtained reacting NH_2Et with **1b** (200 mg, 0.322 mmol), with the same procedure described for the synthesis of **4a**

4b: Yield 146 mg (72%). Found: C, 47.28; H, 4.35, N 4.11%. $C_{25}H_{29}F_3Fe_2N_2O_5S$ requires: C, 47.05; H, 4.58; N, 4.39%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1966vs and 1802s (CO). ¹H NMR (CDCl₃) δ

7.54-7.01 (m, 3H, Me₂C₆H₃); 5.01, 4.96, 4.48, 4.40 (s, 10 H, Cp); 4.84 (s, 3H, NMe); 3.01 (br, 1H, NH₂); 2.65, 2.16 (s, 6H, $Me_2C_6H_3$); 2.25 (q, 2H, ³J_{HH}=7Hz, N-CH₂-CH₃); 0.84, 0.76 (t, 3H, ³J_{HH}=7Hz, N-CH₂-CH₃); -2.70 (br, 1H, NH₂); (Isomer ratio = 10). ¹³C NMR (CDCl₃) δ 338.6 (µ-C); 266.8 (µ-CO); 213.5 (CO); 148.6 (ipso-Me₂C₆H₃); 132.6, 132.5, 130.3, 129.0, 128.9 (Me₂C₆H₃); 88.0, 87.1 (Cp); 54.0 (NMe); 44.1 (N-CH₂-CH₃); 18.5, 17.8, 17.4 ($Me_2C_6H_3$ + NCH₂-CH₃).

3.3. Synthesis of $[Fe{\mu-CN(Me)R}(\mu-CO)(CO)(NH_2Pr^i)(Cp)_2][SO_3CF_3]$ (R = Me, **5a**; R = Xyl **5b**)

A solution of **1a** (180 mg; 0.340 mmol) in THF (15.0 mL) was treated with Me₃NO (50 mg; 0.66 mmol) and NH₂Prⁱ (0.300 mL; 3.52 mmol). The mixture was stirred for 2 h, then the solvent was removed under reduced pressure. Chromatography of the residue on alumina with CH₃CN as eluent, afforded **5a**. Yield 141 mg (74%). Found: C, 40.87; H, 4.23; N, 5.10%. C₁₉H₂₅F₃Fe₂N₂O₅S requires: C, 40.66; H, 4.49; N, 4.99%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1970vs and 1802s (CO). ¹H NMR (CDCl₃) δ 4.84, 4.78 (s, 10H, Cp); 4.70, 4.24 (s, 6H, N*Me*₂); 2.10 (d, 1H, ²J_{HH}= 13 Hz, N*H*₂); 1.74 (m, 1H, C*H*Me₂); 1.30, 0.61 (d, 6H, ³J_{HH}= 6.1 Hz, CH(C*H*₃)₂); -2.36, (d, 1H, ²J_{HH}=13 Hz, N*H*₂).

Compound **5b** was obtained reacting NH_2Pr^i with **1b** (106 mg, 0.170 mmol), with the same procedure described for the synthesis of **5a**.

5b: Yield 80.1 mg (72%). Found: C, 48.01; H, 4.65; N, 4.30%. $C_{26}H_{31}F_{3}Fe_{2}N_{2}O_{5}S$ requires: C, 47.74; H, 4.78; N, 4.28%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1968vs and 1805s (CO). ¹H NMR (CDCl₃) δ 7.35-7.20 (m, 3H, Me₂C₆H₃); 4.99, 4.95, 4.36, 4.41 (s, 10H, Cp); 4.85, 4.83 (s, 3H, NMe); 2.68 (d, 1H, ²J_{HH}= 12.9 Hz, NH₂); 2.73, 2.67, 2.17, 2.13 (s, 6H, Me₂C₆H₃); 1.91 (m, 1H, (CH₃)₂CH); 1.21, 1.13, 0.74, 0.69 (d, 6H, ³J_{HH}= 6.3 Hz, (CH₃)₂CH); -2.22 (d, 1H, ²J_{HH}=12.9 Hz, NH₂); (Isomers ratio = 10). ¹³C NMR (CDCl₃) δ 339.8 (µ-C); 266.1 (µ-CO); 213.7 (CO); 148.7 (ipso-Me₂C₆H₃); 132.5, 130.4, 129.0 (Me₂C₆H₃); 88.6, 88.0, 87.4, 87.0, (Cp); 53.9 (NMe); 48.7 (Me₂CH); 25.1, 20.9 (Me₂CH); 18.8, 17.7 (C₆H₃Me₂). ESI MS: ES+ m/z 503; ES- m/z 149.

3.4. Synthesis of $[Fe \{\mu-CN(Me)(Xyl)\}(\mu-CO)(CO)(NH_2R)(Cp)_2][SO_3CF_3]$ ($R = C_6H_{11}$, **6**; R = Ph, 7; R = H, **8**)

Complexes **6-8** have been obtained by reacting **1b** (100 mg, 0.161 mmol) with the appropriate amine, with the same procedure described for the synthesis of **5b**. Compound **7** was filtered on Celite instead of alumina. Ammonia used for the synthesis of **8** was a 0.5 M solution in 1,4-dioxane.

6: Yield 79 mg (67%). Found: C, 49.97; H, 5.14; N, 4.10%. $C_{29}H_{35}F_3Fe_2N_2O_5S$ requires: C, 50.16; H, 5.08; N, 4.03%. IR (CH₂Cl₂) ν_{max} (cm⁻¹) 1968vs and 1802s (CO). ¹H NMR (CDCl₃) δ 7.40-7.28 (m, 3H, Me₂C₆H₃); 5.05, 4.95, 4.41, 4.33 (s, 10H, Cp); 4.91, 4.81 (s, 3H, NMe); 2.76,

2.66, 2.27, 2.15 (s, 6H, C₆H₃*Me*₂); 2.40 (d, 1H, ²J_{HH}=12.1 Hz, N*H*₂); 2.20-0.82 (m, 11H, C₆*H*₁₁); -2.18, -2.22 (d, 1H, ²J_{HH}=12.1 Hz, N*H*₂); (Isomers ratio = 10). ¹³C NMR (CDCl₃) δ 340.2 (µ-C); 267.4, 266.3 (µ-CO); 213.8, 212.5 (CO); 148.5 (ipso-Me₂C₆H₃); 132.7, 132.2, 130.2, 128.9 (Me₂C₆H₃); 88.6, 88.0, 86.9, 86.4 (Cp); 55.6, 54.8, 35.6, 31.1, 25.0, 24.7 (C₆H₁₁); 53.5, 52.2 (N*Me*); 18.5, 17.6 (C₆H₃*Me*₂).

7: Yield 79 mg (71 %). Found: C, 50.62; H, 4.41; N, 3.98%. $C_{29}H_{29}F_3Fe_2N_2O_5S$ requires: C, 50.64; H, 4.25; N, 4.07%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1965vs and 1808s (CO). ¹H NMR (CDCl₃) δ 7.27-6.60 (m, 9H, arom); 4.97, 4.73, 4.35, 4.32 (s, 10H, Cp); 4.84 (s, 3H, NMe); 4.45 (d, 1H, ²J_{HH}=11.4 Hz, NH₂); 2.33, 2.10, 1.97 (s, 6H, C₆H₃Me₂); -0.16 (d, 1H, ²J_{HH}=11.4 Hz, NH₂); (Isomers ratio = 10). ¹³C NMR (CDCl₃) δ 338.0 (µ-C); 265.9 (µ-CO); 214.4 (CO); 148.4, 142.8, 132.6, 130.2, 128.9, 125.3, 120.6 (arom); 88.4, 87.3 (Cp); 54.4 (NMe); 18.5, 17.8 (C₆H₃Me)

8: Yield 42 mg (42 %). Found: C, 45.01; H, 4.32; N, 4.25%. $C_{23}H_{25}F_3Fe_2N_2O_5S$ requires: C, 45.27; H, 4.13; N, 4.59%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1973vs and 1810s (CO). ¹H NMR (CD₃CN) δ 7.47-7.33 (m, 3H, Me₂C₆H₃); 5.16, 5.12, 4.47, 4.35 (s, 10H, Cp); 4.76, 4.44 (s, 3H, NMe); 2.74, 1.91 (s, 6H, $Me_2C_6H_3$); -0.41, -0.76 (s, 3H, NH₃); (Isomers ratio = 3). ¹³C NMR (CD₃CN) δ 339.0 (µ-C); 268.9 (µ-CO); 214.1 (CO); 149.2 (ipso-Me₂C₆H₃); 135.1, 133.2, 131.1, 130.0, 129.6 (Me₂C₆H₃); 89.7, 87.1 (Cp); 55.7 (NMe); 19.1, 17.8 ($Me_2C_6H_3$)

3.5. Synthesis of $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)(NHR'_2)(Cp)_2][SO_3CF_3]$ (R = R' = Me, **9a**; R = Xyl, R' = Me, **9b**; R = Xyl, $NHR'_2 = NHC_5H_{10}$, **10**)

Complexes 9-10 have been obtained by reacting $[Fe_2\{\mu-CN(Me)R\}(\mu-CO)(CO)_2(Cp)_2]^{Y}[CF_3SO_3]$ (0.200 mmol) with the appropriate secondary amine, in the presence of Me₃NO, using the same procedure described for the synthesis of 4a.

9a: Yield 77 mg (70%) Found: C, 39.63; H, 4.24; 5.16%. $C_{18}H_{23}F_3Fe_2N_2O_5S$ requires: C, 39.50; H, 4.24; N, 5.12%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1974vs and 1801s (CO). ¹H NMR (CDCl₃) δ 4.84, 4.69 (s, 10H, Cp); 4.63, 4.20 (s, 6H, μ -CN*Me*₂); 1.90, 0.94 (d, 6H, ³J_{HH}=5.6 Hz, N*Me*₂,); 1.22 (br, 1H, N*H*). ¹³C NMR (CDCl₃) δ 331.4 (μ -C); 269.1 (μ -CO); 214.4 (CO); 88.3, 86.6 (Cp); 53.9, 52.30 (μ -CN*Me*₂); 47.0, 43.0 (N*Me*₂).

9b: Yield 92 mg (72%). Found: C, 47.19; H, 4.29; N, 4.54%. $C_{25}H_{29}F_3Fe_2N_2O_5S$ requires: C, 47.07; H, 4.58; N, 4.39%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1971vs and 1803s (CO). ¹H NMR (CDCl₃) δ 7.47-6.97

(m, 3H, Me₂C₆*H*₃); 5.04, 4.93, 4.39, 4.31 (s, 10H, Cp); 4.91, 4.87 (s, 3H, NMe); 2.66, 2.21 (s, 6H, C₆H₃Me₂); 2.18 (d, 3H, ${}^{3}J_{HH}$ =6.9 Hz, NMe₂,); 1.24 (br, 1H, NH); 1.09 (d, 3H, ${}^{3}J_{HH}$ =6.2 Hz, NMe₂,); (Isomers ratio = 10). ${}^{13}C$ NMR (CDCl₃) δ 339.3 (µ-C); 266.3 (µ-CO); 215.4. (CO); 148.3 (ipso-Xy); 132.9, 132.8, 130.5, 129.2, 129.0 (Me₂C₆H₃); 89.4, 88.3, 87.8 86.7, (Cp); 54.2, 53.4 (NMe); 49.1, 47.3, 46.9, 44.8 (NMe₂), 18.7, 18.0 (C₆H₃Me₂)

10: Yield 94 mg (69%). Found: C, 49.21; H, 5.02; N, 3.99%. C₂₈H₃₃F₃Fe₂N₂O₅S requires: C, 49.44; H, 4.89; N, 4.12%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1969vs and 1801s (CO). ¹H NMR (CDCl₃) δ 7.40-7.20 (m, 3H, Me₂C₆H₃); 4.99, 4.94, 4.47, 4.42 (s, 10H, Cp); 4.91 (s, 3H, NMe); 2.63, 2.42, 2.17, 2.08 (s, 6H, C₆H₃Me₂); 2.8-2.6, 1.4-1.0 (m, 11H, C₅H₁₀ + NH); (Isomers ratio = 10). ¹³C NMR (CDCl₃) δ 338.5 (µ-C); 267.4 (µ-CO); 215.3. (CO); 148.3 (ipso-Xy); 132.7, 132.3, 130.2, 129.1, 128.9 (Xy); 88.5, 87.9, 87.5, 86.4 (Cp); 54.3 (NMe); 57.4, 54.8, 27.4, 27.1, 22.7 (NH(CH₂)₅); 18.6, 17.7 (C₆H₃Me₂).

3.6. Synthesis of $[Fe_2{\mu-CN(Me)Xyl}(\mu-CO)(CO){C(O)NHEt}(Cp)_2]$ (11)

Gaseous NH₂Et was bubbled into a stirred solution of $[Fe_2\{\mu-CN(Me)(Xyl)\}(\mu-CO)(CO)_2(Cp)_2]^{Y}[CF_3SO_3]$ (**1a**) (98 mg, 0.158 mmol) in THF (15 ml). Then, NaH (18 mg, 0.750 mol) was added and the mixture stirred for further 10 min. Filtration on a celite pad and removal of the volatile materials gave a green solid residue of **11**. Yield 75 mg (92%). Found: C, 58.31; H, 5.19; N, 5.51%. C₂₅H₂₈Fe₂N₂O₃ requires: C, 58.14; H, 5.43; N, 5.42%. IR (CH₂Cl₂) v_{max}(cm⁻¹) 1962vs, 1756s and 1556s (CO); 3276m (NH) in KBr. ¹H NMR (CD₂Cl₂) δ 7.46-7.17 (m, 3H, Me₂C₆H₃); 5.74 (s, br, 1H, NH); 4.74, 4.23 (s, 10H, Cp); 4.45 (s, 3H, NMe); 2.83, 2.74 (m, 2H, N-CH₂-CH₃); 2.59, 2.15 (s, 6H, Me₂C₆H₃); 0.77 (t, 3H, ³J_{HH}=7.3 Hz, N-CH₂-CH₃). ¹³C NMR (CD₂Cl₂) δ 334.3 (μ -C); 274.1 (μ -CO); 214.7 (CO); 202.9 (C(O)NHEt); 149.8 (ipso-Me₂C₆H₃); 135.2, 133.8, 130.4, 128.6, 128.4 (Me₂C₆H₃); 89.0, 86.8 (Cp); 51.3 (NMe); 35.7 (N-CH₂-CH₃); 19.1, 18.0 (Me₂C₆H₃); 15.9 (N-CH₂-CH₃).

3.7. Synthesis of $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)(Py)(Cp)_2][SO_3CF_3]$ (Py = NC₅H₅; R= Me, **12a**; R = Xyl, **12b**)

Complexes **12a-b** have been obtained by reacting pyridine with $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)_2(Cp)_2]^{Y}[CF_3SO_3]$ (0.200 mmol) following the same procedure described for the synthesis of **5a-b**.

12a: Yield 72 mg (68%). Found: C, 47.40; H, 4.11; N, 5.33%. $C_{21}H_{21}F_3Fe_2N_2O_5S$ requires: C, 47.56; H, 3.99; N, 5.28%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1971vs and 1795s (CO). ¹H NMR (CDCl₃) δ 8.15

(d, 2H, ${}^{3}J_{HH}$ = 5.5 Hz, o-Py); 7.37 (t, 1H, ${}^{3}J_{HH}$ = 7.7 Hz, p-Py); 6.94 (t, 2H, ${}^{3}J_{HH}$ =7.0 Hz, m-Py); 4.96, 4.36 (s, 6H, N*Me*₂); 4.94, 4.70 (s, 10H, Cp). ${}^{13}C$ NMR (CDCl₃) δ 332.3 (µ-C); 272.7 (µ-CO); 210.2 (CO); 155.1 (o-Py); 137.3 (p-Py); 124.8 (m-Py); 88.5, 86.7 (Cp); 54.9, 52.8 (N-*Me*₂).

12b Yield 97 mg (78 %): Found: C, 50.18; H, 3.89; N, 4.25%. $C_{28}H_{27}F_3Fe_2N_2O_5S$ requires: C, 50.04; H, 4.05; N, 4.17%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1975vs and 1795s (CO). ¹H NMR (CDCl₃) δ 8.68-6.85 (m, 18H, arom); 5.18, 4.91, 4.51, 4.36, (s, 10H, Cp); 5.21, 4.44 (s, 3H, NMe); 2.91, 2.66, 2.17, 1.06 (s, 6H, C₆H₃Me₂); (Isomers ratio = 2). ¹³C NMR (CDCl₃) δ 339.1, 334.8 (µ-C); 271.7, 270.8 (µ-CO); 211.4, 210.5. (CO); 155.8-122.8 (arom); 89.4, 88.7, 87.8, 87.5 (Cp); 56.1, 54.4 (NMe); 29.4 25.4 (C₆H₃Me₂)

3.7. Synthesis of $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)(HNC=CPh_2)(Cp)_2][SO_3CF_3]$ (R=Me, 13*a*; R=Xyl, 13*b*).

Complexes **13a-b** have been obtained by reacting benzophenone imine (Ph₂C=NH) with [Fe₂{ μ -CN(Me)R}(μ -CO)(CO)₂(Cp)₂]^Y[CF₃SO₃] (0.300 mmol) following the same procedure described for the synthesis of **5a-b**.

13a: Yield 161 (76%). Found: C, 50.91; H, 4.05; N, 4.21%. C₂₉H₂₇F₃Fe₂N₂O₅S requires: C, 50.76; H, 3.97; N, 4.08%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1974vs and 1803s (CO). ¹H NMR (CDCl₃) δ 7.68-7.20 (m, 10H, arom); 6.09 (s, 1H, N*H*); 5.00, 4.52 (s, 10H, Cp); 4.80, 4.43 (s, 6H, N*Me*₂). ¹³C NMR (CDCl₃) δ 332.0 (µ-C); 267.6 (µ-CO); 211.8 (CO); 191.5 (N=C); 137.8-126.4(arom); 88.6, 87.6 (Cp); 54.1, 52.7 (N-*Me*₂).

13b: 182 mg (78 %). Found: C, 55.89; H, 4.28; N, 3.85%. $C_{36}H_{33}F_3Fe_2N_2O_5S$ requires: C, 55.71; H, 4.29; N, 3.61%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1978vs and 1813s (CO); 3276m (NH) in KBr. ¹H NMR (CDCl₃) δ 7.73-6.88 (m, 13H, arom); 6.29 (s, 1H, N*H*); 4.88, 4.54, 4.36, 4.34 (s, 10H, Cp); 4.94, 4.92 (s, 3H, N*Me*); 2.58, 2.14 (s,6H, C₆H₃*Me*₂); (Isomers ratio = 4). ¹³C NMR (CDCl₃) δ 340.3 (µ-C); 264.7 (µ-CO); 212.3. (CO); 192.0 (N=C); 147.9 (ipso-Xyl); 140.0-125.0 (arom); 88.3, 87.8, 87.3, 87.1 (Cp); 54.2, 53.8 (N-*Me*); 18.4, 17.5 (C₆H₃*Me*). ESI MS: ES+ *m/z* 625; ES- *m/z* 149.

3.8. Synthesis of $[Fe_2 \{\mu - \eta^l : \eta^2 - C = C(Tol)C(Ph)_2N(H)CN(Me)(Xy)\}(\mu - CO)(CO)(Cp_2)]$ (15).

TolC=CLi (0.58 mmol in THF) was added dropwise to a solution of **1b** (148 mg, 0.19 mmol) in THF (10 mL) at -50 °C and the resulting solution was stirred at room temperature for 30 min. The solvent, then, was removed *in vacuo* and the residue dissolved in CH₂Cl₂ (5 mL) and filtered through an Al₂O₃ pad. Subsequently, the filtrate was evaporated and washed with petroleum

ether (3x5 mL). The final product was further purified by chromatography on an Al₂O₃ column using CH₂Cl₂ as eluent. Yield 73.4 mg (52 %). Found: C, 71.33; H, 5.15; N, 4.10%. C₄₄H₄₀Fe₂N₂O₂ requires: C, 71.15; H, 5.43; N, 3.79%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1934vs and 1734s (CO); 3321m (NH) in KBr. ¹H NMR (CD₂Cl₂) δ 8.87 (br, 1H, N*H*), 7.78-6.55 (m, 17H, 2Ph + Xyl + Tol), 4.51, 4.08 (s, 10H, Cp), 3.94 (s, 3H, N*Me*), 2.20 (s, 3H, p-*Me*C₆H₄), 2.18, 1.82 (s, 6H, C₆H₃*Me*₂). ¹³C NMR (CD₂Cl₂) δ 285.8, 280.6 (μ -C=C + μ -CO), 220.5 (C=Fe), 216.3 (CO), 149.4, 147.6, 146.7, 141.6, 141.0 (ipso Xyl + ipso Tol + ipso 2Ph + μ -C=C), 136.0, 134.9, 133.2 (*C*-Me Tol + Xyl), 131.7-126.5 (*C*-H arom), 87.2, 86.5 (Cp), 78.2 (CPh₂), 43.4 (N*Me*), 21.0 (p-*Me*C₆H₄), 18.1, 17.6 (C₆H₃*Me*₂). ESI MS: ES+ *m/z* 740.

3.9. Synthesis of $[Fe_2 \{\mu - \eta^l : \eta^2 - C = C(Ph)C(Ph)_2N(H)CN(Me)(Xy)\}(\mu - CO)(CO)(Cp_2)]$ (16).

Compound **16** was obtained following a procedure similar to that reported for **15**, using PhC=CLi instead of TolC=CLi. Yield 42.9 mg (31 %). Found: C, 71.22; H, 4.95; N, 3.68%. $C_{43}H_{37}Fe_2N_2O_2$ requires: C, 70.94; H, 5.12; N, 3.85%. IR (CH₂Cl₂) v_{max} (cm⁻¹) 1936vs and 1735s (CO); 3321m (NH) in KBr. ¹H NMR (CD₂Cl₂) δ 7.80 (br, 1H, N*H*), 7.60-6.53 (m, 18H, 3Ph + Xyl), 4.49, 4.08 (s, 10H, Cp), 3.93 (s, 3H, N*Me*), 2.16, 1.84 (s, 6H, C₆H₃*Me*₂).

3.10 Crystallography.

Crystal data for $4a[CF_3SO_3]$ and $15 \cdot 0.5CH_2Cl_2$ were collected at room temperature on a Bruker AXS SMART 2000 CCD diffractometer using graphite monochromated Mo-K α radiation. Structures were solved by direct methods and structures refined by full-matrix least-squares based on all data using F^2 [19]. Crystal data are listed in Table 3. Non-H atoms were refined anisotropically, unless otherwise stated. H-atoms were placed in calculated positions, except position of the N-bonded H atom in $15 \cdot 0.5CH_2Cl_2$ which was located in the Fourier map. H-atoms were treated isotropically using the 1.2 fold U_{iso} value of the parent atom except methyl protons, which were assigned the 1.5 fold U_{iso} value of the parent C-atom.

Crystals of **4a** are pseudo-merohedrally twinned. The TWIN routine of SHELX97 was used during the refinement with the appropriate twin matrix $(1 \ 0 \ 0 \ -1 \ 0 \ 0 \ -1)$, giving a final BASF factor of 0.41156.

The two Cp rings in $4a[CF_3SO_3]$ and the molecule of CH₂Cl₂ in $15 \cdot 0.5CH_2Cl_2$ are disordered. Disordered atomic positions were split and refined isotropically using similar distance and similar *U* restraints and one occupancy parameter per disordered group.

Crystal data and experimental details for 4a[CF₃SO₃] and 15.0.5CH₂Cl₂.

4. Supplementary material

Crystallographic data for the structural analyses have been deposited with the Cambridge Crytsallographic Data Centre, CCDC no. 245010 for **4a**[CF₃SO₃] and 245011 for **15**•0.5CH₂Cl₂. Copies of this information can be obtained free of charge from the Director, CCDC, 12 Union Road, Cambridge CB2 1EZ, UK (fax: +44-1233-336033; <u>deposit@ccdc.cam.ac.uk</u> or <u>www.ccdc.cam.ac.uk</u>).

Acknowledgements.

Diiron-aminocarbyne complexes with amine or imine ligands: C-N coupling between imine and aminocarbyne ligands promoted by tolylacetylide addition to [Fe₂{µ-CN(Me)R}(µ-CO)(CO)(NH=CPh₂)(Cp)₂][SO₃CF₃]

Luigi Busetto, Fabio Marchetti, Stefano Zacchini, Valerio Zanotti^{*} and Eleonora Zoli.

Dipartimento di Chimica Fisica ed Inorganica, Università di Bologna, Viale Risorgimento 4, I-40136 Bologna, Italy

Primary and secondary amines, pyridine and benzophenone imine can be coordinated in the dinuclear complexes $[Fe_2{\mu-CN(Me)R}(\mu-CO)(CO)_2(Cp)_2][SO_3CF_3]$ (R = Me, Xyl) *via* CO displacement, promoted by Me₃NO. The imino complex **13b** reacts with p-tolylacetylide, generating C-C and C-N bonds with formation of a new bridging vinylidene-diaminocarbene complexes **15**.
