A COMPUTER PROGRAM VERSION OF THE BROUWER ORBITAL THEORY WITH OPTIONAL MODIFICATIONS

1. INTRODUCTION

This report describes a program which computes osculating elements and position-velocity vectors in an earth satellite orbit according to the Brouwer theory (Brouwer 1959). Options for certain modifications have been added. Basic orbital data are written on a tape called orbital tape which may be used as input to other programs for further processing.

The program written in Fortran IV for the IBM 360 computer is an adaptation of a program constructed and described by Repass and Chaplick (1965)*. It is intended to further revise and extend the program. In view of these intentions this report is to be considered as an interim report. No concentrated effort has been made to remove all imperfections in the documentation and to check out the program thoroughly. This will be done with the final version. Spot checks have shown that the program is working correctly and is giving correct results.

2. THE BROUWER THEORY

The Brouwer theory (Brouwer 1959) is a first order theory giving expressions for the osculating values of the Keplerian elements of a satellite orbit.

To some degree of accuracy the earth's potential at a point at distance r from the earth's center of mass and at latitude β with respect to the equator is given by (IAU 1962)

$$U = \frac{\mu}{r}\left[1 - \sum_{n=1}^{\infty} J_n \left(\frac{R}{r}\right)^n P_n (\sin \beta)\right] \qquad (1)$$

where $P_n(x)$ is the Legendre polynomial of degree n. The constant $\mu = GM_E$ is the product of the gravitational constant G and the mass M_E of the earth and has the dimension length cubed/time squared. The quantity R is the mean equatorial radius of the earth. The coefficient J_n is called the coefficient of the zonal harmonic of order n or briefly the zonal harmonic of order n or the n'th harmonic. Since the center of mass of earth is taken as origin $J_1 = 0$. The J_n are small quantities. It is customary to consider J_2 as a small quantity of the first order and all J_n with $n > 2$ as small quantities of at least second order.

*The primary purpose of this program is not to study orbits but to use the Brouwer theory in an application.

There are also longitude dependent terms in U which Brouwer neglects together with the zonal harmonics of order $n > 5$. For the purposes of his theory he writes

$$U = \frac{\mu}{r} + \frac{\mu k_2}{r^3}(1 - 3\sin^2\beta) + \frac{\mu A_{30}}{r^4}\left(-\frac{3}{2}\sin\beta + \frac{5}{2}\sin^3\beta\right)$$

$$+ \frac{\mu k_4}{r^5}\left(1 - 10\sin^2\beta + \frac{35}{3}\sin^4\beta\right) \qquad (2)$$

$$+ \frac{\mu A_{50}}{r^6}\left(\frac{15}{8}\sin\beta - \frac{35}{4}\sin^3\beta + \frac{63}{8}\sin^5\beta\right)$$

where

$$\begin{aligned} k_2 &= \frac{1}{2} J_2 R^2 \\ A_{30} &= - J_3 R^3 \\ k_4 &= -\frac{3}{8} J_4 R^4 \\ A_{50} &= - J_5 R^5 \end{aligned} \qquad (3)$$

In addition to the constant μ we shall also use the constant k defined by

$$k^2 = \mu \qquad (4)$$

If a spherical earth were the only attracting body the potential due to the earth would be μ/r, i.e. all J_n with $n \geq 2$ would be zero. The orbit of the satellite would be Keplerian, i.e. the motion would take place in a fixed elliptic orbit according to the laws of Kepler. Using well known formulae, the rectangular coordinates and velocity components in megameters and megameters per hour respectively with respect to the equator and equinox of some epoch may be computed from the Keplerian elements

a = semi-major axis in megameters

e = eccentricity

I = inclination
Ω = right ascension of ascending node } with respect to equator and equinox
ω = argument of perigee
M = mean anomaly
} in degrees

The elements a, e, I, Ω, ω are constants whereas M is a linear function of the time given by

$$M = M_0 + M_1 t \tag{5}$$

where

$$M_1 = k\, a^{-3/2} \tag{6}$$

is the mean motion of the satellite.

If τ is measured in hours and M_1 in degrees per hour then $\tau = 360/M_1$ is the period of revolution of the satellite in its closed orbit.

If a non-spherical earth is assumed, i.e. if the J_n with $n \geq 2$ are no longer all assumed to be zero, the same formulae for computing the coordinates and velocity components may be used but the quantities a, e, I, Ω, ω occurring in these formulae are no longer constants and M is no longer a linear function of the time. The variable values

$$a,\ e,\ I,\ \Omega,\ \omega,\ M$$

occuring in these formulae under the assumption of a non-spherical earth are called the osculating values of the Keplerian elements and are solutions of certain differential equations. It is the purpose of the Brouwer theory to find approximate expressions for the solutions of these differential equations under the assumption that all J_n with $n > 5$ are zero. The deviations of the expressions for the osculating values from the Keplerian values are of order J_2 but it must be mentioned that e occurs as a divisor.

It should be noted that in the following description of the Brouwer theory the unit of length is the megameter, the unit of time the hour and that angles are expressed in degrees. These are not the units employed by Brouwer in his paper.

In the Brouwer theory an epoch T and six constants

$$\left.\begin{array}{ll} a_0 & \text{in megameters} \\ e_0 & \\ I_0 & \\ \Omega_0 & \\ \omega_0 & \text{in degrees} \\ M_0 & \end{array}\right.$$

are chosen. Associated with them a solution of the equations of motion for a, e, I, Ω, ω, M of the form

$$\begin{aligned} a_B &= a_0 + \delta a \\ e_B &= e_0 + \delta e \\ I_B &= I_0 + \delta I \\ \Omega_B &= \Omega_0 + \Omega_{10}\, t + \delta \Omega \\ \omega_B &= \omega_0 + \omega_{10}\, t + \delta \omega \\ M_B &= M_0 + M_{10}\, t + \delta M \end{aligned} \tag{7}$$

is constructed. The subscript B has been added to indicate that we deal here with approximate expressions based on the Brouwer theory proper.

In these expressions t is time in hours from the epoch. The quantities

$$\Omega_{10},\ \omega_{10},\ M_{10}$$

are constants expressed in degrees per hour and are called the secular motions of Ω_B, ω_B, M_B. The linear functions

$$\begin{aligned} \Omega'' &= \Omega_0 + \Omega_{10}\, t \\ \omega'' &= \omega_0 + \omega_{10}\, t \\ M'' &= M_0 + M_{10}\, t \end{aligned} \tag{8}$$

are called the secular portions of Ω_B, ω_B, M_B respectively. The secular portions of a_B, e_B, I_B are the constants defined by

$$\begin{aligned} a'' &= a_0 \\ e'' &= e_0 \\ I'' &= I_0 \end{aligned} \tag{9}$$

and thus have no linear terms.

The secular motion M_{10} of M_B is approximately equal to the mean motion the satellite would have if it were moving in a Keplerian orbit close to the actual orbit and is of the order of 180° per hour for a close earth satellite. It is computed to order J_2^2. No confusion will arise if we call $360/M_{10}$ the period of the satellite even though the actual orbit is not closed and the motion is not periodic. But after a period which is of the order of 2 hours the satellite will return to approximately the same position in space. This is so since M_{10} deviates only by terms at least of the order J_2 from the value it would have in a nearby Keplerian orbit and since Ω_{10} and ω_{10} being at least of order J_2 are also small. Since Ω_{10} and ω_{10} which are computed to order J_2^2 are thus much smaller than M_{10} it will take the secular portions of Ω_B and ω_B to complete an arc of 360° in a time much longer than the period of satellite. In general, times of the order of 100 days are required.

The quantities

δa in megameters

δe

δI, $\delta \Omega$, $\delta \omega$, δM in degrees

are series of periodic terms and are called the periodic perturbations of the respective elements. They are of order J_2 and are computed to that order only.

The Brouwer theory thus represents the osculating elements as the sums of secular portions and periodic perturbations. The periodic perturbations are not necessarily equal to zero at the epoch (t = 0) so that

$$a_0,\ e_0,\ I_0,\ \Omega_0,\ \omega_0,\ M_0$$

are not necessarily equal to the osculating values of

$$a,\ e,\ I,\ \Omega,\ \omega,\ M$$

at the epoch. A theory could have been constructed where this would have been the case but the periodic perturbations would have been much greater and the accuracy of the theory would have suffered.

For this reason

$$a_0,\ e_0,\ I_0,\ \Omega_0,\ \omega_0,\ M_0$$

are called the Brouwer mean elements for epoch T. However, the first three of these quantities are independent of the epoch. The latter three change linearly with the epoch. In particular

a_0 = Brouwer mean semi-major axis in megameters

e_0 = Brouwer mean eccentricity

I_0 = Brouwer mean inclination

Ω_0 = Brouwer mean right ascension of the node

ω_0 = Brouwer mean argument of perigee

M_0 = Brouwer mean mean anomaly

} in degrees

There are two types of periodic terms occurring in the periodic terms. The long-period terms are terms whose periods are long compared with the period of the satellite while the short-period terms have periods of comparable size with the period of the satellite or less. In particular terms whose arguments are linear combinations with small integer coefficients of the secular portions of Ω_B and ω_B are long-period terms.

We thus write

$$\begin{aligned}
\delta a &= \delta_s a \\
\delta e &= \delta_L e + \delta_s e \\
\delta I &= \delta_L I + \delta_s I \\
\delta \Omega &= \delta_L \Omega + \delta_s \Omega \\
\delta \omega &= \delta_L \omega + \delta_s \omega \\
\delta M &= \delta_L M + \delta_s M
\end{aligned} \tag{10}$$

where the subscripts L and S indicate long- and short-period terms respectively. There are no long-period terms in a.

While long-period terms are explicitly written down as Fourier series whose arguments are linear functions of the time, this is not the case for the short-period terms where the true anomaly which is not linear in t is used in the arguments.

The long-period portions of the elements are indicated by primes and are defined to be the sums of the secular portions and the long-period perturbations. Using (8) and (9) and noting that there are no long-period terms in a we find

$$
\begin{aligned}
a' &= a'' &&= a_0 \\
e' &= e'' + \delta_L e = e_0 &&+ \delta_L e \\
I' &= I'' + \delta_L I = I_0 &&+ \delta_L I \\
\Omega' &= \Omega'' + \delta_L \Omega = \Omega_0 + \Omega_{10}\, t &&+ \delta_L \Omega \\
\omega' &= \omega'' + \delta_L \omega = \omega_0 + \omega_{10}\, t &&+ \delta_L \omega \\
M' &= M'' + \delta_L M = M_0 + M_{10}\, t &&+ \delta_L M
\end{aligned}
\tag{11}
$$

The Brouwer expressions for the osculating elements are thus equal to the sums of the long-period portions and the short-period perturbations. Thus

$$
\begin{aligned}
a_B &= a_0 &&+ \delta_s a = a' + \delta_s a \\
e_B &= e_0 &&+ \delta_L e + \delta_s e = e' + \delta_s e \\
I_B &= I_0 &&+ \delta_L I + \delta_s I = I' + \delta_s I \\
\Omega_B &= \Omega_0 + \Omega_{10}\, t + \delta_L \Omega + \delta_s \Omega = \Omega' + \delta_s \Omega \\
\omega_B &= \omega_0 + \omega_{10}\, t + \delta_L \omega + \delta_s \omega = \omega' + \delta_s \omega \\
M_B &= M_0 + M_{10}\, t + \delta_L M + \delta_s M = M' + \delta_s M
\end{aligned}
\tag{12}
$$

Brouwer computes the short-period perturbations by making use of the von Zeipel method (von Zeipel 1916–1918). This method furnishes the short-period perturbations as functions of the long-period portions. However, Brouwer uses in these functions the secular portions e'', I'' instead of the long-period portions e', I'. Since he intended to find the short-period terms to order J_2 only and since his procedure causes an error only of order J_2^2 this is legitimate. We shall come back to this point on page 8.

It should be noted that Brouwer does not compute the periodic perturbations directly but computes first the periodic perturbations in the Delaunay variables

$$L,\ G,\ H,\ l,\ g,\ h$$

which are defined by

$$\begin{aligned} L &= (a\mu)^{1/2} \\ G &= L(1-e^2)^{1/2} \\ H &= G\cos I \\ l &= M \\ g &= \omega \\ h &= \Omega \end{aligned} \tag{13}$$

3. OPTIONAL MODIFICATIONS OF THE BROUWER THEORY

The program input contains an option which allows the computaton of M_{10} according to Kozai rather than according to Brouwer. This is accomplished by adding to the value according to Brouwer, which is of the second order, the difference δM_{10} of the value according to Kozai which is likewise used as far as to order J_2^2 minus the value according to Brouwer. Mathematical details concerning this are given in Appendix C (pp. 189–200).

There is a further option which states whether the long-period terms are to be included or not and another option whether the short-period perturbations are to be included or not. If they are to be included two further options will be available. In one of these the short-period terms are computed, as Brouwer does, with the secular portions e'' and I'', instead of with the long-period portions e' and I' as required by the theory. The error (see page 7) is of the second order and is of no consequence if one limits oneself as Brouwer does to short-period terms of the first order. However, it may be desirable to use second-order short-period terms in the semi-major axis a. Then it is essential to have the short-period terms in a computed with e' and I'. The second option provides for the computation of the short-period terms with e' and I' in a and also e, I, Ω, ω, M.

The second order short-period terms in a are important since they have an appreciable effect on the secular motion of M as computed from the Brouwer mean elements corresponding to a given position-velocity vector using Brouwer's or Kozai's formulation for the mean motion of the mean anomaly.

The values of these short-period terms computed by the program are based on expressions given by Kozai (Kozai 1962) and may be optionally included in any run with the program being described here. Mathematical details will be found in Appendix C (pp. 189-200).

For the purpose of studying discrepancies with other orbit generators it will be useful to have the option of adding certain terms to the Brouwer expressions even though with the added terms the expressions may no longer correspond to a gravitational solution within the order specified by Brouwer.

The terms that may be added are linear, quadratic, and cubic terms in the time in the semi-major axis, eccentricity, and inclination. The Brouwer theory provides for linear terms in time in the right ascension of the node, the argument of perigee, and the mean anomaly. Any additional linear terms and quadratic and cubic terms may be added. Finally, up to 99 sines and cosines may be added to the six elements. The arguments of the sines and cosines are arbitrary linear functions of the time. The same arguments must be used for each of the six elements. The sum of the sines and cosines for each of the six elements will be referred to as the supplementary perturbation of this element.

The optional additions to the Brouwer theory discussed may be written in the form

$$
\begin{aligned}
\delta_a a &= a_1 t + a_2 (0.01\,t)^2 + a_3 (0.01\,t)^3 + \delta_2 a + \delta_{sup}\, a && \text{in } a \\
\delta_a e &= e_1 t + e_2 (0.01\,t)^2 + e_3 (0.01\,t)^3 + \delta_{sup}\, e && \text{in } e \\
\delta_a I &= I_1 t + I_2 (0.01\,t)^2 + I_3 (0.01\,t)^3 + \delta_{sup}\, I && \text{in } I \\
\delta_a \Omega &= d\Omega_1 t + \Omega_2 (0.01\,t)^2 + \Omega_3 (0.01\,t)^3 + \delta_{sup}\, \Omega && \text{in } \Omega \\
\delta_a \omega &= d\omega_1 t + \omega_2 (0.01\,t)^2 + \omega_3 (0.01\,t)^3 + \delta_{sup}\, \omega && \text{in } \omega \\
\delta_a M &= (\delta M_{10} + dM_1)\, t + M_2 (0.01\,t)^2 + M_3 (0.01\,t)^3 + \delta_{sup}\, M && \text{in } M
\end{aligned}
\qquad (14)
$$

The quantities

a_1 in megameters per hour

e_1 per hour

$I_1, d\Omega_1, d\omega_1, dM_1$ in degrees per hour

define the optional additional linear terms and

a_2 in megameters per (100 hours)^2

e_2 per (100 hours)^2

$I_2, \Omega_2, \omega_2, M_2$ in degrees per (100 hours)^2

and

a_3 in megameters per (100 hours)^3

e_3 per (100 hours)^3

$I_3, \Omega_3, \omega_3, M_3$ in degrees per (100 hours)^3

the optional quadratic and cubic terms. For scaling purposes 100 hours instead of 1 hour is the unit of time in these terms.

The quantity δM_{10} is the optional reduction of the mean motion from Brouwer to Kozai. The quantity $\delta_2 a$ is the sum of the optional second order short-period terms in a and

$$\delta_{sup} a, \quad \delta_{sup} e, \quad \delta_{sup} I, \quad \delta_{sup} \Omega, \quad \delta_{sup} \omega, \quad \delta_{sup} M$$

are the optional supplementary perturbations.

4. THE BASIC ORBIT GENERATOR FUNCTION

The first basic orbit generator function consists in computing complete expressions for the osculating values of the elements

a = semi-major axis in megameters

e = eccentricity

I = inclination

Ω = right ascension of ascending node } with respect to equator and equinox

ω = argument of perigee

M = mean anomaly

} in degrees

at t hours from the epoch by means of the formulae

$$
\begin{aligned}
a &= a_B + \delta_a a \\
e &= e_B + \delta_a e \\
I &= I_B + \delta_a I \\
\Omega &= \Omega_B + \delta_a \Omega \\
\omega &= \omega_B + \delta_a \omega \\
M &= M_B + \delta_a M
\end{aligned}
\qquad (15)
$$

Here the first terms of the right hand members are given by (12) and correspond to the Brouwer theory proper with the added option that the short-period terms may be computed with either e", I" or e', I'. The second terms of the right-hand members represent the optional additional terms given by (14). Their inclusion may cause the osculating values to be no longer consistent with a gravitational solution within the order specified by Brouwer.

To compute the osculating values of the elements for any t the following quantities are required:

Geophysical constants

R = mean equatorial radius of the earth in megameters

GM_E = product of the gravitational constant and mass of the earth in km cubed/seconds squared

J_2, J_3, J_4, J_5 zonal harmonics of orders 2-5

Epoch (calendar date and time of day)

Orbital parameters

Mean Brouwer elements

a_0 semi-major axis in megameters

e_0 eccentricity

I_0 inclination } with respect to equator and equinox

Ω_0 right ascension of ascending node } with respect to equator and equinox

ω_0 argument of perigee } in degrees

M_0 mean anomaly } in degrees

Additional Secular Coefficients

Linear coefficients

rate a_1 in megameters per hour

rate e_1 per hour

motion I, and additional motions $d\Omega_1, d\omega_1, dM_1$ in degrees per hour

Quadratic Coefficients

a_2 in megameters per (100 hours)^2

e_2 per (100 hours)^2

$I_2, \Omega_2, \omega_2, M_2$ in degrees per (100 hours)^2

Cubic Coefficients

a_3 in megameters per (100 hours)^3

e_3 per (100 hours)^3

$I_3, \Omega_3, \omega_3, M_3$ in degrees per (100 hours)^3

Further it must be indicated whether the reduction of the mean motion of the mean anomaly from Brouwer to Kozai, the long-period perturbations, the short-period perturbations, the second order short-period terms in a, and the supplementary perturbations are to be included. If supplementary perturbations are to be included each argument occurring in them is to be defined by giving its value in degrees at an epoch to be specified and its change in degrees per hour and the coefficients of the cosine and sine of this argument in each of the six elements. The epochs to be specified for the arguments may be different for each argument and need not coincide with the epoch of the Brouwer mean elements.

Finally, an indication must be given whether the short-period terms are to be computed with e",I" or e',I'.

If expressions based on the Brouwer theory proper are desired the additional secular coefficients are to be put equal to zero, i.e. one has to use

$$a_1 = e_1 = I_1 = d\Omega_1 = d\omega_1 = dM_1 = 0$$

$$a_2 = e_2 = I_2 = \Omega_2 = \omega_2 = M_2 = 0$$

$$a_3 = e_3 = I_3 = \Omega_3 = \omega_3 = M_3 = 0$$

and choose the options not to include the reduction of the mean motion of the mean anomaly from Brouwer to Kozai, to include the long- and short-period perturbations, to compute the latter with e'', I'', not to include the second order short-period terms in a, and not to include any supplementary perturbations.

The second basic orbit generator function consists in computing for t the rectangular equatorial coordinates

$$x, y, z \quad \text{in megameters}$$

and the equatorial velocity components

$$\dot{x}, \dot{y}, \dot{z} \quad \text{in megameters per hour}$$

This process includes solving Kepler's equation for the eccentric anomaly.

For convenience sake the radius vector in megameters and the eccentric and true anomalies in degrees are included in the output.

The results are arranged in form of one or several ephemerides. For each ephemeris a starting and ending time and a step size must be specified. For each ephemeris point

$$x, y, z, \dot{x}, \dot{y}, \dot{z}$$

and the osculating values are written on an orbital tape. The format is described in Section 9. Information is also written out on the standard output tape at specified frequencies.

5. ALTERNATIVE OPERATIONS OF THE PROGRAM

The input necessary for the basic orbit generator functions has been described in Section 4. However, two alternatives are available.

Instead of the Brouwer mean elements the osculating values

a = semi-major axis in megameters

e = eccentricity

I = inclination

Ω = right ascension of the ascending node } with respect to equator and equinox

ω = argument of perigee

M = mean anomaly

} in degrees

at the epoch may be used in the input. All other quantities of the input must be used as described in Section 4. The program then determines by an iteration process those Brouwer mean elements which together with the remaining quantities of the input would produce the osculating values of the input. After these Brouwer mean elements have been determined the program operates as described in Section 4.

As a second alternative, instead of the Brouwer mean elements, the values of the rectangular equatorial coordinates

$$x, y, z \quad \text{in megameters}$$

and of the rectangular equatorial velocity components

$$\dot{x}, \dot{y}, \dot{z} \quad \text{in megameters per hour}$$

at the epoch may be used in the input. All other quantities of the input must be used as described in Section 4. The program then determines first the values of the osculating elements a, e, I, Ω, ω, M at the epoch and then, as in the preceding case, by an iterative process, those Brouwer mean elements which would produce these osculating values. After these have been found the program operates as described in Section 4.

6. UNITS

The unit of length used in the input described in Section 4 or the alternatives described in Section 5 is the megameter. The unit of time is the hour. Angles are given in degrees. Velocity components and coefficients of linear terms are given per hour and coefficients of the quadratic and cubic terms in t are given per $(100 \text{ hour})^2$ and $(100 \text{ hours})^3$ respectively.

Other orbit generator programs have used other units. An alternate choice of units is possible with the present program. So called canonical units may be used instead of the units described above. The canonical unit of length (cul) is the mean equatorial radius of the earth and the canonical unit of time (cut) is that unit which together with the canonical unit of length causes the constant μ in expressions (1) and (2) for the earth's potential to be unity. It is

$$R^{3/2} \, (GM)^{-1/2} \quad \text{seconds}$$

if R is measured in cm and GM_E in $cm^3 \, sec^{-2}$.

Coefficients of the linear terms are then expressed per cut and coefficients of quadratic and cubic terms per $(cut)^2$ and $(cut)^3$ respectively.

7. BRIEF DESCRIPTION OF THE PROGRAM

The main program is designated as P73. It requires the following subroutines (SR) and function programs except for library routines. Subroutines are called and function programs indicated by * are merely used by name without the command CALL.

ADLH	BRWR4	KOMEAN	SSWTCH
ALLOT*	DJUL*	MAD*	SUPP0
ATANQ*	DMAD*	PARA	SUPP1
ATANZ*	ELRV	POLVAL	TIMC4
BBRWR	HMSRZ*	RHMSZ	WRT6
BRWR1	JULCAL	RVELZ	XKEP*
BRWR2			

The listings for P73 and the subroutines listed above are given in Appendix A (pp. 21-172). An index appears on p. 22.

All routines except for

ADLH, BRWR4, KOMEAN, POLVAL, SSWTCH, SUPP0, SUPP1, WRT6

were contained, possibly under a slightly different name, in the original Repass program package.

SR ADLH is a slight modification of a program ADDL described by Agreen and Fisher (1968). SR BRWR4 is a modification of BRWR2, and KOMEAN, POLVAL, SUPP0, SUPP1, and WRT6 have been designed by the author. SSWTCH is a routine simulating the sense switches of the IBM 7094 machines.

In the listings for P73, BRWR4, and all other routines originating from a routine of the Repass program package except in the case of DMAD and MAD, the following information or parts of it, often appear:

Purpose (Brief description of function of program or routine)
Calling sequence to be used
Input
Output
Reference
Method
Restrictions
Accuracy
Required subprograms
Timing
Analysis

This information appears also in the listing for BRWR4. Above information in many cases is, however, characterized as not available. The list of required subprograms refers only to first level subprograms, i.e. a program called by a subprogram of some routine is not listed.

In case of the routines where a list of required subprograms is not given the required subprograms may be ascertained from the compilation.

A brief description of the present program package follows.

The main program, P73, reads the input except for the ephemeris specifications which are read by TIMC4, and the specifications for the supplementary perturbations which are read by SUPP0 if required.

The action of PARA depends on which of the three alternative input options discussed in Sections 4 and 5 are used. If Brouwer mean elements are used in the input PARA determines the values of the osculating elements at the epoch by employing the basic orbit generator functions to be described in some detail below. If the values of the osculating elements at the epoch are used in the input no processing occurs in PARA. Finally, if the position-velocity vector at the epoch is used in the input then the values of the osculating elements at the epoch are determined by RVELZ. No further processing occurs.

Thus in every case, after completion of PARA, the values of the osculating elements at the epoch will be available. With the help of ELRV the position-velocity vector at the epoch is determined. In case the values of the osculating elements at epoch or the position-velocity vector at epoch, were used in the input, i.e. if the Brouwer mean elements were not used in the input, they are now determined. This will be done by BBRWR using an iterative process. If the Brouwer mean elements are used in the input then BBRWR is bypassed. In every case a point in the program is reached when the Brouwer mean elements are known and the basic orbit generator functions discussed in Section 4 may be carried out.

These functions start out with the Brouwer mean elements. The coefficients of the secular and long-period terms are computed in BRWR1. This need be done just once regardless how many ephemeris points are to be processed. If the reduction of the mean motion of the mean anomaly from Brouwer to Kozai is to be included it is found from KOMEAN.

For the epoch and every ephemeris point to be processed, the expressions for the long-period terms are evaluated and the short-period perturbations are computed. Then the complete values of the osculating elements are formed and the position-velocity vector is obtained. All these tasks are accomplished by BRWR2 or BRWR4 according to whether e", I" or e', I' are used in the computation of the short-period perturbations. If the second order short-period

terms in a are to be included a call in BRWR2 and BRWR4 to ADLH is necessary.* If supplementary perturbations are to be included then a call in BRWR2 and BRWR4 to SUPP1 is necessary. After the complete values of the osculating elements have been formed in BRWR2 or BRWR4 the position-velocity vector is determined with the help of ELRV. One step in this procedure consists in solving Kepler's equation which requires the use of XKEP.

The writing of the orbital tape is done in the main program P73 by WRT6.

Several routines and function programs have not yet been mentioned in this brief description. ALLOT reduces an angle modulo 2π. ATANZ and ATANQ find an angle from its sine and cosine or its sine and cosine multiplied by a constant respectively. DJUL and JULCAL are used in converting from calendar date to Julian day and vice versa. DMAD and MAD compute remainders from divisions. HSMRZ and RHMSZ convert from hours, minutes, seconds to radians and from radians to days, hours, minutes, seconds respectively. Finally, POLVAL computes polynomials.

8. DESCRIPTION OF INPUT DECK

The cards of the input deck are described in the listings in Appendix A of the programs where they are read. For convenience sake the relevant information alone is listed in Appendix B (pp. 173-187).

Several cases may be run. For each case there are cards numbered 1-9 with several cards for some numbers, in which case distinguishing letters and numbers are used. Some of the cards are omitted under special conditions. After the last case a number 1 and a number 2 card must follow. The latter must have a 0 in cols. 1-3.

In each case, one or several ephemerides may be computed. Certain data for every ephemeris point are written out on a tape called orbital tape, the format of which is described in Section 9.

The quantity KPR in columns 60-65 of card 9 indicates how often the data for ephemeris points are to be written on the standard output tape.

9. ORBITAL TAPES

The orbital tape is an EBCDIC tape containing double precision data for one or several orbits. Each orbit corresponds to one file on the tape.

---

*In view of the discussion on page 8 it would not be realistic to include the second order short-period terms in a and to compute the short-period terms with e", I".

Each file contains a lead record and orbital data for one or several sets of equidistant dates.

The available orbital data are coordinates, velocities, and osculating elements.

Format

Lead record:

NCASE	orbit number
CASE	object + orbit number (object number is the integral portion, orbit number is the decimal portion)
NTIME	= 0
NPLAN	= 0
NOTHER	= 0
JA(I), I = 1, . . . , 8	= 0
INPUT	= 0
ORB1	= 0.D 00
ORB2	= 0.D 00

Format 1X, I3, F8.3, I5, 2I4, 8I3, I4, 2F8.3

For each ephemeris point there are three record

Record 1: time in minutes from epoch

$\left.\begin{matrix} x \\ y \\ z \end{matrix}\right\}$ in megameters

$\left.\begin{matrix} \dot{x} \\ \dot{y} \\ \dot{z} \end{matrix}\right\}$ in megameters per hour

Format 1X, I5, 6D21.14

Record 2: time in minutes from epoch
0.D 00
0.D 00
0.D 00

Format 1X, I5, 3D23.16

Record 3: time in minutes from epoch

a	osculating value of	semi-major axis in megameters		in degrees
e		eccentricity		
I		inclination	with respect to equator and equinox	
Ω		right ascension of ascending node		
ω		argument of perigee		
M		mean anomaly		

Format 1X, I5, 6D21.14

There are other programs which produce the same type of tape where the quantities which are zero in the lead record are not necessarily zero and where record 2 of the orbital data contains accelerations instead of zeros. A future version of this program will produce these accelerations on the orbital tape.

Orbital tapes may be input to other programs. One such programs forms the differences of orbital data from two orbits which are represented either by two files of one orbital tape or two files from two orbital tapes.

10. DESCRIPTION OF OUTPUT ON STANDARD OUTPUT

After printing the title page, the input options from card 2 of input deck are listed. A statement concerning units follows. With this information, the value of a constant in another orbit generator program, vis SATPOS (Walther and Wales, 1967) is included. After this information, a list of the values used for the required geophysical constants is given. If supplementary perturbations are to be included the arguments and coefficients occurring in these are listed. Then the input orbital parameters in the units used in the input are listed and repeated in the alternate units. Information concerning the tolerance and maximum number of iterations allowed in solving Kepler's equation follows.

A table showing the coefficients of the secular and long-period terms constitutes the next group of data. The basis of the calculation of the mean motion of the mean anomaly is given. The values of the Brouwer mean elements, osculating elements, and the components of the position-velocity vector at the epoch are then shown in several units.

After this ephemeris data are printed. Preceding the data for the individual data points information on the limits of the ephemeris and frequency of printing is given. For each ephemeris point, in general, sixteen lines of numerical data are given in the form of two blocks. The first contains twelve, the second four lines.

The first line of the first block contains the date in several forms and the time from the epoch in minutes. Lines 2-12 give information on various portions of the osculating elements. Line 2 gives the gravitational secular portions, i.e. the values of the secular portions as derived from the Brouwer theory proper with the possible effect of the optional reduction of the mean motion of the mean anomaly from Brouwer to Kozai included. The optional secular terms are given in lines 3-5 leading to the total secular portions on line 6. Line 7 gives the long-period perturbations leading to the long-period portions in line 8. The short-period perturbations, second order short-period perturbations, and supplementary perturbations follow in lines 9-11. The complete values of the osculating elements are then given in line 12, the last line of the first block.

The first line of the second block lists the radius vector, eccentric and true anomalies. The next two lines show the number of iterations required to solve Kepler's equation and the last relative correction obtained for the approximation to the solution. The final line of the block contains the values of the components of the position-velocity vector.

There are some options to be specified in the input which allow additional output to be printed, i.e. detailed output of some phases of the computations. These additional outputs are printed if certain fields of columns on card 2 of the input deck contain quantities not zero. If a zero is in one of these fields the corresponding output will not be printed.

If the quantity in cols. 19-21 of card 2 of the input deck is not zero intermediate output from BRWR1 will be printed. It is not labelled. For identification the program listing of BRWR1 must be consulted.

If the quantity in cols. 43-45 of card 2 of the input deck is not zero intermediate output from KOMEAN will be printed. It is not labelled. For identification the program listing of KOMEAN must be consulted.

If the second order short-period terms in a are desired and if the quantity in cols. 31-33 of card 2 of the input deck is not zero details of the computation of the second order short-period terms in a are given for all ephemeris points for which data are given in the standard output. There is little labelling in this detailed output, which appears between lines 1 and 2 of the first block of twelve lines referred to above. Identification should be made with the help of the program listings of ADLH, BRWR2, or BRWR4.

Finally, if supplementary perturbations are desired and if the quantity in cols. 37-39 of card 2 of the input deck is not zero intermediate quantities in the computation of the supplementary perturbations are printed for every ephemeris point for which data are printed in the standard output. This additional output is labelled and appears also between lines 1 and 2 of the first block of twelve lines referred to above.

APPENDIX C

MATHEMATICAL DETAILS OF MODIFICATION OF THE BROUWER THEORY

APPENDIX C

Mathematical Details of Modification of the Brouwer Theory

The unit of length in this section is the mean equatorial radius of the earth. Let the quantities designated in Section 2 by

$$a_0,\ e_0,\ I_0$$

be designated here by

$$A'',\ E'',\ I''$$

They are the constant terms in the expressions in the Brouwer theory for a, e, I. Introduce the quantities

$$\epsilon'',\ P'',\ \Theta''$$

by means of

$$\begin{aligned} \epsilon'' &= (1 - E''^2)^{1/2} \\ P'' &= A''\ \epsilon''^2 \\ \Theta'' &= \cos I'' \end{aligned} \tag{C-1}$$

The Keplerian mean motion n_0 is then given by

$$n_0 = \mu^{1/2}\ A''^{-3/2} \tag{C-2}$$

where μ is the constant appearing in (1). With the adopted unit for lengths and any unit for time μ is determined.

The mean motion of the mean anomaly ℓ_B as used in the Brouwer theory is the first time derivative of the secular portion ℓ''_B of ℓ_B and is given by

$$\frac{d\ell''_B}{dt} = n_0\ \{1 + J_2\ B_{21} + J_2^2\ B_{22} + J_4\ B_4\} \tag{C-3}$$

where

$$B_{21} = \frac{3}{4} P''^{-2} \epsilon'' (-1 + 3\Theta''^2)$$

$$B_{22} = \frac{3}{128} P''^{-4} \epsilon'' [(-15 + 16\epsilon'' + 25\epsilon''^2) + (30 - 96\epsilon'' - 90\epsilon''^2)\Theta''^2 + (105 + 144\epsilon'' + 25\epsilon''^2)\Theta''^4] \quad \text{(C-4)}$$

$$B_4 = -\frac{45}{128} P''^{-4} \epsilon'' E''^2 [3 - 30\Theta''^2 + 35\Theta''^4]$$

Kozai like Brouwer uses as basic dependent variables the Delaunay variables

$$L,\ G,\ H,\ l,\ g,\ h$$

defined by (13).

The complete solutions for L, G, H, l, g, h according to Kozai are of the form

$$L = L'' + \delta L, \quad l = l'' + \delta l$$
$$G = G'' + \delta G, \quad g = g'' + \delta g \quad \text{(C-5)}$$
$$H = H'', \quad h = h'' + \delta h$$

Here L'', G'', H'' are constants and l'', g'', h'' are linear functions of the time. Whereas δG, δl, δg, δh contain long- and short-period perturbations, there are only short-period terms present in δL.

The secular portions of a, e, i are designated by double primes and equations for the quantities

$$a'',\ e'',\ i''$$

are obtained from(13) by replacing L, G, H by L'', G'', H'' and a, e, I by a'', e'', i''.

Then p'', η'', θ'' are introduced by means of

$$p'' = a'' (1 - e''^2)$$

$$\eta'' = \frac{G''}{L''} = (1 - e''^2)^{1/2} \qquad \text{(C-6)}$$

$$\theta'' = \cos i'' = H''/G''$$

The quantity n'' is defined by

$$n'' = \mu^2 L''^{-3} = \mu^{1/2} a''^{-3/2} \qquad \text{(C-7)}$$

For the computation of the mean motion of the mean anomaly from equation (7.1) in Kozai's article seventeen functions M_i, $i = 0, 1, \ldots 16$ are introduced. They are defined by

$$M_0 = 1 - 5\theta''^2 \qquad M_1 = e'' (1 - \theta''^2) (1 - 5\theta''^2)^{-2} = e'' (1 - \theta''^2)/M_0^2$$

$$M_2 = 3 (1 - \theta''^2) \qquad M_3 = 1 - 15\theta''^2 \qquad M_4 = 5 (1 - 7\theta''^2)$$

$$M_5 = 2 e''^2 (1 - 5\theta''^2)^{-1} = 2 e''^2/M_0$$

$$M_6 = (1 - 43\theta''^2 + 155\theta''^4 - 225\theta''^6) (1 - 15\theta''^2) = (1 - 43\theta''^2 + 155\theta''^4 - 225\theta''^6) M_3$$

$$M_7 = 10 (1 - 42\theta''^2 + 408\theta''^4 - 1270\theta''^6 + 1575\theta''^8) \qquad \text{(C-8)}$$

$$M_8 = 25 (1 - 19\theta''^2 + 75\theta''^4 - 105\theta''^6) (1 - 7\theta''^2) = 5 (1 - 19\theta''^2 + 75\theta''^4 - 105\theta''^6) M_4$$

$$M_9 = e''^{-1} (1 - \theta''^2 - 2 e''^2 \theta''^2) \qquad M_{10} = 16 [(32 - 59\theta''^2) + 6 e''^2 (8 - 13\theta''^2)]$$

$$M_{11} = 4 (1 - \theta''^2) (1 - 5\theta''^2)^{-2} = \frac{4}{3} M_2/M_0^2 \qquad M_{12} = e''^2 (1 - 5\theta''^2)^{-3} = e''^2/M_0^3$$

$$M_{13} = (4 - 127\theta''^2 + 480\theta''^4 - 525\theta''^6) M_3$$

$$M_{14} = 10 (4 - 139\theta''^2 + 1273\theta''^4 - 3805\theta''^6 + 3675\theta''^8)$$

$$M_{15} = 5 (4 - 63\theta''^2 + 232\theta''^4 - 245\theta''^6) M_4$$

$$M_{16} = - (1 - \theta''^2)^{-1/2} \theta'' [2 (1 - \theta''^2) + e''^2 (2 - 3\theta''^2)]$$

Then the auxiliary constants

$$a_0,\ e_0,\ i_0,\ p_0,$$

defined by equations (6.27) - (6.30) in Kozai's article and the constants

$$\eta_0,\ \theta_0$$

are obtained by successive approximations from

$$a_0 = a'' \left[1 + \frac{3}{4 p_0^2} (1 - e_0^2)^{1/2} (1 - 3\theta_0^2)\, J_2\right]$$

$$e_0 = e'' + (J_2^2/1024\, a''\, p''^3)\, M_1 \left\{M_2 \left[M_3 + \frac{J_4}{J_2} M_4\right]^2 + M_5 \left[M_6 + M_7 \frac{J_4}{J_2^2} + M_8 \left(\frac{J_4}{J_2^2}\right)^2\right]\right\}$$

$$+ (J_3^2/J_2^2)\, (1/16\, a''\, p'')\, M_9 \qquad \text{(C-9)}$$

$$i_0 = i'' - (J_2^2/2048\, p''^4) \sin 2i''$$

$$\times \left\{M_{10} + M_{11} \left[M_3 + M_4 \frac{J_4}{J_2^2}\right]^2 + M_{12} \left[M_{13} + M_{14} \frac{J_4}{J_2} + M_{15} \left(\frac{J_4}{J_2}\right)^2\right]\right\}$$

$$+ (J_3^2/J_2^2)\, (1/16\, p''^2)\, M_{16}$$

$$p_0 = a_0 (1 - e_0^2)$$

$$\eta_0 = (1 - e_0^2)^{1/2}$$

$$\theta_0 = \cos i_0$$

The mean motion of the mean anomaly as used in the Kozai theory will be denoted now by $d\ell_K/dt$ and is equal to the first derivative of the secular portion ℓ''_K of ℓ_K and is given according to equation (7.1) in Kozai's article by

$$\frac{d\ell''_K}{dt} = n''_0 \{1 + K_{21} J_2 + K_{22} J_2^2 + K_4 J_4\} \tag{C-10}$$

where

$$K_{21} = -\frac{3}{4 p_0^2} \eta_0 (1 - 3\theta_0^2)$$

$$K_{22} = \frac{3}{128 p_0^4} \eta_0 [10 (1 - 6\theta_0^2 + 13\theta_0^4) - 5 e_0^2 (5 - 18\theta_0^2 + 5\theta_0^4) - 32 \eta_0 (1 - 3\theta_0^2)^2] \tag{C-11}$$

$$K_4 = -\frac{45}{128 p_0^4} e_0^2 \eta_0 (3 - 30\theta_0^2 + 35\theta_0^4)$$

In the expression for K_4 Kozai's p_0^2 has been replaced by p_0^4.

If the Brouwer theory is modified so that the second order short-period terms in a are included, then it may not be unreasonable to assume that

$$a''_0 = A'' \tag{C-12}$$

and that

$$e''_0 = E'', \quad i''_0 = I'' \text{ to order } J_2 \tag{C-13}$$

Then from (C-2), (C-7), (C-12)

$$n_0 = n'' \tag{C-14}$$

so that (C-3) and (C-10) lead to

$$\delta n = \frac{d\ell''_K}{dt} - \frac{d\ell''_B}{dt}$$

$$= n_0 \{(K_{21} - B_{21}) J_2 + (K_{22} - B_{22}) J_2^2 + (K_4 - B_4) J_4\} \tag{C-15}$$

According to (C-13) $e'' - E''$ and $i'' - I''$ are of order J_2^2 and according to (C-9) the quantities δe and δi defined by

$$\delta e = e_0 - e''$$

$$\delta i = i_0 - i'' \tag{C-16}$$

and

$$\delta\Theta = -\sin I'' \, \delta i \tag{C-17}$$

are of order J_2^2.

It may be conceivable that the differences $e'' - E''$ and $i'' - I''$ are even smaller than the second order of J_2. Only if we make this assumption will we be able to derive a fairly simple approximation for $d\ell''_K/dt - d\ell''_B/dt$. The assumption implies

$$e_0 = E'' + \delta e$$

$$i_0 = I'' + \delta i \tag{C-18}$$

$$\theta_0 = \Theta'' + \delta\Theta$$

where δe and δi are computed from (C-16) and $\delta\theta$ from (C-17). Using two successive iterations of (C9) we find that to order J_2^2

$$a_0 = A'' \, [1 + \gamma J_2 - 2 \gamma^2 J_2^2] \tag{C-19}$$

where

$$\gamma = \frac{3 \epsilon''}{4 P''^2} (1 - 3\Theta''^2) \tag{C-20}$$

Then we obtain the following correction

$$\delta n = n_0 \left\{ J_2^3 (\gamma^3 - 4\gamma B_{22}) - 4 B_4 \gamma J_2 J_4 + \frac{3E''}{\epsilon''^2} J_2 \delta e - \frac{6\Theta''}{1 - 3\Theta''^2} J_2 \delta\Theta \right\} \quad \text{(C-21)}$$

to the mean motion of the mean anomaly computed according to Brouwer. This correction will probably make the mean motion to be closer to the value according to Kozai.

To free oneself from above assumptions, one would have to make use of more portions of the Kozai theory. This probably would mean so much involvement with the Kozai theory that it might just as well be used exclusively and the purpose of deriving a reduction from Brouwer's to Kozai's mean motion would be defeated.

The long period portions $L', G', H', \ell', g', h'$ of L, G, H, ℓ, g, h are given by

$$\begin{aligned} L' &= L'' \quad , \quad \ell' = \ell'' + \delta_L \ell \\ G' &= G'' + \delta_L G \, , \quad g' = g'' + \delta_L g \\ H' &= H'' \quad , \quad h' = h'' + \delta_L h \end{aligned} \quad \text{(C-22)}$$

there being no long-period perturbations in L and H.

The quantities

$$\delta_L G, \ \delta_L \ell, \ \delta_L g, \ \delta_L h$$

are the long-period perturbations in G, ℓ, g, h.

We define

$$a', \ e', \ i'$$

by means of (13) by replacing L, G, H, a, e, I by the primed quantities L', G', H', a', e', i'. We also introduce η', θ' by means of

$$\begin{aligned} \eta' &= (1 - e'^2)^{1/2} = G'/L' \\ \theta' &= H''/G' = \cos i' \end{aligned} \quad \text{(C-23)}$$

Let f' be the true anomaly and $\rho' = r'/a'$ the ratio r/a computed from e' and ℓ'. Finally define g^*, B'_{20}, B'_{22} by

$$g^* = g' - \frac{3\mu^2 J_2}{4G'^4}(1 - 5\theta'^2)(f' - \ell')$$

$$B'_{20} = -\frac{1}{4}(1 - 3\theta'^2) \qquad \text{(C-24)}$$

$$B'_{22} = \frac{3}{4}(1 - \theta'^2)$$

The perturbations δL of L, which consist of short-period terms, are then given by (see equation (3.8) in Kozai's article)

$$\delta L = \frac{\mu^2 J_2}{L'^3}\left\{B'_{20}\left[\frac{a'^3}{r'^3} - \eta'^{-3}\right] + B'_{22}\frac{a'^3}{r'^3}\cos 2(f' + g^*)\right\} + \delta_2 L \qquad \text{(C-25)}$$

where $\delta_2 L$ are second order terms due to J_2^2, J_3, J_4. They have been programmed for an electronic computer by Agreen and Fisher (1968).

The first term of the right hand member of (C-25) represents the first order term in δL according to Kozai. Brouwer who uses only first order terms in δL which he then converts to a perturbation in a uses a similar expression but instead of g^* he uses g'. In order to facilitate comparison of Kozai's expression for δL with Brouwer's expression to be given below we rewrite (C-25) and make use of (C-24). We then obtain

$$\delta L = \delta_1 L + \delta'_2 L + \delta_2 L \qquad \text{(C-26)}$$

where

$$\delta_1 L = \frac{\mu J_2}{4L'a'}\{(-1 + 3\theta'^2)(\rho'^{-3} - \eta'^{-3}) + 3(1 - \theta'^2)\rho'^{-3}\cos 2(f' + g')\} \qquad \text{(C-27)}$$

and

$$\delta'_2 L = \frac{9}{8}\frac{\mu^4 J_2^2}{G'^7}\frac{a'^3}{r'^3}\eta'^3(1 - 5\theta'^2)(1 - \theta'^2)(f' - \ell')\sin 2(f' + g') \qquad \text{(C-28)}$$

The quantity $\delta_2' L$ represents the reduction of the first order term of (C-25) with g^* replaced by g' to the form as it appears in (C-25).

From (13) and (C-26) we obtain to the second order

$$a = a'' + \delta_1 a + \frac{1}{\mu} 2L'' (\delta_2' L + \delta_2 L) + \frac{\delta_1^2 a}{4 a''} \tag{C-29}$$

where

$$\delta_1 a = \frac{2L' \delta_1 L}{\mu} = \frac{1}{2} \frac{J_2}{a'} \{(-1 + 3\theta'^2)(\rho'^{-3} - \eta'^{-3}) + 3(1 - \theta'^2) \rho'^{-3} \cos 2(f' + g')\}$$

$$= J_2 \phi \left(a', \theta', \eta', \frac{r'}{a'}, f', g'\right) \tag{C-30}$$

Here

$$\phi \left(a, \theta, \eta, \frac{r}{a}, f, g\right) = \frac{1}{2a} \left\{(-1 + 3\theta^2) \left(\frac{a}{r} - \eta^{-3}\right) + 3(1 - \theta^2) \frac{a^3}{r^3} \cos 2(f + g)\right\} \tag{C-31}$$

Here r/a and f are the ratio of radius vector and semi-major axis and the true anomaly computed from the eccentricity and mean anomaly according to the laws of Keplerian motion.

According to the Brouwer theory

$$a = A'' + \delta_s A \tag{C-32}$$

where $\delta_s A$ are the short-period terms in a assumed to be computed with e', I'. This expression is

$$\delta_s A = J_2 \phi \left(A', \Theta', \epsilon', \frac{r'}{A'}, f', g'_B\right) \tag{C-33}$$

where ϕ is the same function as the one appearing in (C-30), where g'_B is the long-period portion of g, according to Brouwer, and where r'/A' and f' are the ratio of radius vector and semi-major axis and true anomaly computed from the long-period portions of the eccentricity and mean anomaly.

From (C-29) and (C-32) follows

$$a'' = A'' + \{(\delta_s A)_0 - (\delta_1 a)_0\} - \frac{1}{\mu} 2L'' \left[(\delta'_2 L)_0 + (\delta_2 L)_0\right] - \frac{(\delta_1 a)_0^2}{4a''} \tag{C-34}$$

where parentheses with subscripts 0 indicate values at the epoch.

Let us assume that the long-period portions of e , i , Ω , ω, M as computed by Brouwer and Kozai differ at most by terms of order J_2, which is a reasonable assumption.

Since in (C-30) and (C-33) occur the same function ϕ the difference $\delta_1 a - \delta_s A$ is at least of order J_2^2. Then (C-34) implies that a'' - A'' will be at least of order J_2^2. Also, the first two terms in the right hand member of (C-29) will be of the same form as the right hand member of (C-32).

Thus while we cannot prove it, it may be conceivably true that to order J_2^2 (C-29) may be replaced by

$$a = A'' + \delta_s A + \frac{1}{\mu} 2L'' (\delta'_2 L + \delta_2 L) + \frac{\delta_s^2 A}{4A''} \tag{C-35}$$

where $\delta'_2 L$, $\delta_2 L$ are based on quantities computed according to Brouwer instead of Kozai. The terms in (C-35) additional to A'' and $\delta_s A$ consisting of second order short-period terms may lead to an improvement of the Brouwer expression for a.

We might note again, that the term with $\delta'_2 L$ allows for the fact that Brouwer uses g' while Kozai uses g^* in the first order perturbations of L. The term $\delta_2 L$ represents the second order terms in L in the Kozai theory due to J_2^2, J_3 , J_4 but based on quantities obtained in the Brouwer theory. The last term in (C-35) is a second order term due to the conversion from L to a.

The modifications of the Brouwer theory given by (C-21) and (C-35) will be tested experimentally. Results will be reported in a later report.
