# CALCULATION OF TRANSPORT PROPERTIES OF IONIZING ATOMIC HYDROGEN

by Norman T. Grier

Lewis Research Center

## SUMMARY

The viscosity, thermal conductivity, electrical conductivity, binary diffusion coefficient, multicomponent diffusion coefficient, and thermal diffusion coefficient are calculated for equilibrium ionizing atomic hydrogen for temperatures from 5000° to 40 000° K at pressures from  $10^{-5}$  to  $10^2$  atmospheres. Rigorous first- and second-approximation equations are used throughout. The collision cross section for all the interactions are presented in tabular form.

## INTRODUCTION

In recent years considerable interest has developed in the transport properties of gases at temperatures sufficiently high for dissociation and ionization to be important. In this temperature range experimental measurements are difficult, if not impossible, and the most accurate sources of information at present are theoretical calculations based on equations obtained from kinetic theory. The transport properties of hydrogen in the temperature range where dissociation is important are calculated in references 1 and 2. No ionization of hydrogen was considered in these calculations. In this report, the transport properties of ionizing atomic hydrogen are calculated. Rigorous first- and second-approximation equations based on the moment method and the Chapman-Enskog method of solving the Boltzmann equation are used. A critical evaluation of these approximations is discussed by Ahtye (ref. 3) and DeVoto (ref. 4).

The calculations are made for pressures ranging from  $10^{-5}$  to  $10^2$  atmospheres and temperatures ranging from 5000° to 40 000° K. As is shown in the following paragraph, these calculations may be thought of as an extension of the results of references 1 and 2 to higher temperatures.

An estimate of the range of pressures and temperatures where references 1 and 2 and the present results are valid may be made from figure 1, where one of the two curves corresponds to temperatures and pressures where the mole fraction of molecular hydrogen is  $5 \times 10^{-4}$  and the other corresponds to temperatures and pressures where the mole fraction of atomic hydrogen ions is  $5 \times 10^{-4}$ . Results of references 1 and 2 should be valid in region I of figure 1, and the present results should be valid in region II. The shaded region is the overlap region where dissociation and ionization reactions should be considered simultaneously. Even in this region, however, the mole fraction of molecular hydrogen is always

less than 0.02, and the data of references 1 and 2 may be faired smoothly into the present results. To show this, the thermal conductivity was calculated for temperatures between 5000<sup>o</sup> and 15 000<sup>o</sup> K at a pressure of 10<sup>2</sup> atmospheres including both dissociation and ionization. The results, together with the data from reference 1 and the present calculation, are plotted in figure 2. It is seen that only a small error would be introduced if a smooth curve is drawn to connect the results of reference 1 to the present results. The thermal conductivity was chosen for the illustration since it is the transport property most sensitive to chemical reactions. A pressure of 10<sup>2</sup> atmospheres was chosen because it has the largest range of temperatures where both dissociation and ionization occur simultaneously.

Yos (ref. 5) has calculated the transport properties of ionizing hydrogen for pressures of 1, 3, 10, and 30 atmospheres and temperatures up to 30 000<sup>o</sup> K. The present calculation differs from that of Yos in that rigorous equations are used throughout, additional transport coefficients were calculated, and the calculations were made over a wider temperature and pressure range. Also, in the present calculation of the thermal conductivity, an additional term  $\lambda_d$  is included.

#### ASSUMPTIONS

The calculations made in this investigation are based on the following assumptions:

- (1) The ideal gas law is valid for an ionized gas.
- (2) The number of neutral hydrogen atoms in the excited states are negligible.
- (3) The first-approximation equations for viscosity and the second-approximation equations for translational thermal conductivity, binary diffusion coefficient, thermal diffusion coefficient, electrical conductivity, and multi-component diffusion coefficients are valid.
- (4) The contribution to the thermal conductivity due to chemical reaction may be calculated by the expression given by Butler and Brokaw (ref. 6) with the use of the multicomponent diffusion coefficient as suggested in reference 7.

#### Validity of Assumptions

Zeleznik and Gordon (ref. 8) have investigated the deviation of a plasma from ideal gas behavior. They present their results so that the deviation of the compressibility factor  $Z$  (equal to  $pV/RT$ ) from unity indicates the departure from ideal behavior. (All symbols are defined in appendix A.) Using their expression to calculate  $Z$  at a temperature of 20 000<sup>o</sup> K and a pressure of 10<sup>2</sup> atmospheres gave a value of approximately 1.01. Since the correction factor for  $Z$  decreases for increasing temperatures and decreasing pressures, it is expected that the gas will deviate less than 1 percent from ideality for most of

the conditions calculated. Then, assumption (1) is a good approximation.

With regard to assumption (2), Rosenbaum and Levitt (ref. 9) show that, for hydrogen gas at temperatures less than 20 000° K and pressures of 10<sup>2</sup> atmospheres or less, the contribution of the excited states to the atom partition function is negligible compared with the ground-state contribution. Since the concentration of hydrogen atoms is less than 0.1 percent for temperatures greater than 20 000° K, it is expected that the atoms in the excited states will contribute a negligible amount to the transport coefficients.

An estimate of the error introduced by assumption (3) may be obtained from reference 4, in which equations to the fourth approximation are given for all the transport coefficients except viscosity, where only the second approximation is given. Also, the deviation of the higher approximations from the first approximation for a completely ionized binary gas for several ion to electron mass ratios is included. For an ion to electron mass ratio of 1836 (hydrogen), the first approximation for the viscosity and the second approximation for the other coefficients, except the translational thermal conductivity were within 15 percent of the higher approximations. The values obtained by using the third approximation for the translational thermal conductivity were approximately twice the values obtained by using the second approximation and were approximately equal to the values obtained by using the fourth approximation. Therefore, with the exception of the translational thermal conductivity, the transport properties presented herein should be within 15 percent of the higher approximation values for the collision cross sections used.

With regard to assumption (4) the expression of Butler and Brokaw for the reaction contribution to the thermal conductivity was derived for dissociating reactions by neglecting thermal diffusion and assuming that the first approximation to the diffusion coefficients was valid. Ahtye (ref. 3) and DeVoto (ref. 4) state that for an ionizing gas, thermal diffusion may be important and should be considered. In addition, Ahtye states that the charge separation field  $\vec{E}_s$  caused by the difference in the ion and electron concentration gradients should be considered. Meador and Staton (ref. 7) rederived the heat-conductivity equation to include the effects of the charge separation field  $\vec{E}_s$  and the thermal diffusion on the reaction contribution to the total heat conductivity. The conclusion reached by Meador and Staton (ref. 7) was that Butler and Brokaw's expression is valid for ionization including a charge separation field and thermal diffusion if the diffusion coefficients in their expression are identified as the multicomponent rather than the binary coefficients.

## TRANSPORT COEFFICIENTS

The basic theory of transport phenomena is given in the books of Chapman and Cowling (ref. 10) and Hirschfelder, Curtiss, and Bird (ref. 11). A brief review of the derivation of the transport coefficients is given in references 3 and 4. Only the defining equation for the coefficients will be given here. The notation used is that of DeVoto (ref. 4) and Chapter VII of Hirschfelder, et al. (ref. 11).

The multicomponent diffusion coefficients  $D_{ij}$  and the thermal diffusion coefficients  $D_i^T$  are defined from the general expression for the diffusion velocity of the  $i^{\text{th}}$  species relative to the mass average velocity

$$\langle \vec{V}_i \rangle = \frac{n^2}{n_i \rho} \sum_{\substack{j=1 \\ j \neq i}}^{\nu} m_j D_{ij} \vec{d}_j - \frac{1}{n_i m_i} D_i^T \frac{\partial \ln T}{\partial \vec{r}} \quad (1)$$

where  $\vec{d}_j$  is a sum of terms proportional to the concentration gradient, the pressure gradient, and the difference in the external forces  $\vec{X}$  acting on the various species of molecules,

$$\vec{d}_j = \frac{\partial}{\partial \vec{r}} \left( \frac{n_j}{n} \right) + \left( \frac{n_j}{n} - \frac{n_j m_j}{\rho} \right) \frac{\partial \ln p}{\partial \vec{r}} - \left( \frac{n_j m_j}{p \rho} \right) \left( \frac{\rho}{m_j} \vec{X}_j - \sum_{l=1}^{\nu} n_l X_l \right) \quad (2)$$

and  $\nu$  is the total number of different species contained in the gas. When  $\nu$  is 2,  $D_{ij}$  is the binary diffusion coefficient.

When the energy flux for a monatomic, reacting gas with no internal energy is written in the form (ref. 7)

$$q = -\lambda \frac{\partial T}{\partial \vec{r}} \quad (3)$$

The coefficient  $\lambda$  is defined as the thermal conductivity coefficient. References 4 and 7 show that  $\lambda$  is composed of three terms:

$$\lambda = \lambda_t + \lambda_r + \lambda_d$$

where  $\lambda_t$  is the translational contribution,  $\lambda_r$  is the reaction contribution, and, from reference 7,

$$\lambda_d = \left[ \frac{x_H}{(x_e + x_H)} \right] \left( \frac{kT D_{H-H^+} D_e^T}{m D_{e-H^+}} \right) \left( \frac{\partial \ln k_p}{\partial T} \right) \quad (4)$$

The viscosity coefficient  $\eta$  is defined by the relation

$$\tilde{P} = p\tilde{U} - 2\eta\tilde{S} \quad (5)$$

where  $\tilde{P}$  is the pressure tensor and  $\tilde{S}$  is the rate of shear tensor.

The total current  $\vec{J}$  is written in the form

$$\vec{J} = \sigma \vec{E} + \alpha \frac{\partial T}{\partial \vec{r}} \quad (6)$$

where  $\vec{E}$  is the electric field and  $\sigma$  is defined as the electrical conductivity.

Explicit expressions for the first or second approximations to the preceding transport coefficients are given in appendix B.

### COLLISION INTEGRAL

The equations for the transport properties in appendix B contain the average collision cross section  $\bar{\Omega}_{ij}^{(l,s)}$ , which is defined by the equation

$$\bar{\Omega}_{ij}^{(l,s)} = \frac{\Omega_{ij}^{(l,s)} \sqrt{\frac{2\pi\mu_{ij}}{kT}}}{\frac{1}{2} (s+1)! \left[ 1 - \frac{1}{2} \frac{1 + (-1)^l}{1+l} \right] \pi} \quad (7)$$

where  $\Omega_{ij}^{(l,s)}$  is the collision integral

$$\Omega_{ij}^{(l,s)} = \sqrt{\frac{kT}{2\pi\mu_{ij}}} \int_0^\infty e^{-\gamma_{ij}^2} \gamma_{ij}^{2s+3} Q_{ij}^{(l)} d\gamma_{ij} \quad (8)$$

$Q_{ij}^{(l)}$  is the monoenergetic collision cross section

$$Q_{ij}^{(l)} = 2\pi \int_0^\infty (1 - \cos^l \chi) b db \quad (9)$$

$\gamma_{ij}$  is the reduced relative velocity ( $\sqrt{\mu_{ij}/2kT} g$ ) and  $\chi$  is the angle of deflection between the relative velocity vectors of the two colliding particles before and after the collision. The scattering angle  $\chi$  is a function of the interaction potential  $\phi$  (see eq. 8.2-1 of ref. 11). The collision integrals for each interaction will be considered separately in the following paragraphs.

### Hydrogen Atom - Hydrogen Atom Collisions

When two hydrogen atoms in their ground states collide, the interaction can occur along either of two potentials. Out of every four H-H collisions, there is a possibility that one will follow a  $^1\Sigma$  energy curve corresponding to the normal hydrogen molecule and that three will follow the  $^3\Sigma$  energy curve

corresponding to the lowest repulsive state of hydrogen. For the potential energy of interaction corresponding to the  $^3\Sigma$  energy curve, an exponential-repulsive potential was used in the calculations, and for the potential energy related to the  $^1\Sigma$  energy curve, an exponential-attractive potential was used. For both these exponential potentials, the equation was of the form

$$\varphi(r) = Ae^{-r/\rho} \quad (10)$$

where  $r$  is the distance of separation of the two colliding particles and  $A$  and  $\rho$  are suitable parameters peculiar to the interaction. The constant  $A$  is positive for repulsion and negative for attraction. For the  $^3\Sigma$  interaction, the parameters  $A$  and  $\rho$  were taken from reference 12. For the  $^1\Sigma$  interaction, the data of reference 13 were empirically fitted to the exponential potential for  $\varphi(r)$  between  $10^{-4}$  and 1 electron volt by using the method of least squares. The results are

$$\text{H-H } ^1\Sigma: \varphi(r) = -80 e^{-\frac{r}{0.3922}}, \text{ eV}$$

$$\text{H-H } ^3\Sigma: \varphi(r) = 60.4 e^{-\frac{r}{0.3319}}, \text{ eV}$$

where  $r$  is in angstroms. With the parameters  $A$  and  $\rho$ , the quantities  $\bar{\Omega}^{(l,s)}: ^3\Sigma \text{ H-H}$  and  $\bar{\Omega}^{(l,s)}: ^1\Sigma \text{ H-H}$  were obtained by using the tabulations in references 14 and 15, respectively. In the equations for the transport properties, the  $\bar{\Omega}^{(l,s)}$  used was weighted with its multiplicity, therefore

$$\bar{\Omega}_{\text{H-H}}^{(l,s)} = \frac{1}{4} \bar{\Omega}_{\text{H-H}:^1\Sigma}^{(l,s)} + \frac{3}{4} \bar{\Omega}_{\text{H-H}:^3\Sigma}^{(l,s)}$$

#### Hydrogen Atom - Hydrogen Ion Collisions

For these collisions, it is necessary to consider the effects of resonant charge exchange on the collision integrals. In reference 16 these effects are discussed and it is shown that, only for odd values of  $l$ , are the collision integrals  $\Omega^{(l,s)}$  affected by charge exchange and independent of the  $s$  values. Therefore, the collision integrals  $\Omega^{(2,s)}$  are independent of charge exchange. In the first and second approximations, the only odd value of  $l$  that appears in the transport properties equations is  $l$  equals 1. Reference 16 shows that at high temperatures, the collision integrals  $\Omega^{(1,s)}$  are given to a high degree of accuracy by

$$\Omega^{(1,s)} = 2\Omega_{\text{ex}}^{(1,s)} = \sqrt{\frac{2kT}{\pi\mu}} \int_0^\infty e^{-r^2} r^{(2s+3)} Q_{\text{ex}}^{(1)} dr \quad (11)$$

where  $\Omega^{(l,s)}$  is the charge exchange collision integral and  $Q_{ex}^{(1)}$  is the monoenergetic collision cross section for charge exchange.

The monoenergetic collision cross section was calculated by using the expressions given in reference 17. The results for  $Q_{ex}^{(1)}$  in angstroms<sup>2</sup> were then fitted to the expression

$$Q_{ex}^{(1)} = (B - C \ln E)^2, \text{ \AA}^2 \quad (12)$$

where  $B = 5.44$ ,  $C = 0.442$ , and  $E$  is the relative energy in ergs before the collision. Equation (12) was then substituted in equation (11) and the resulting expression was integrated to obtain  $\Omega_{ex}^{(1,s)}$ . The result is given in appendix C.

The collision integrals  $\Omega^{(2,2)}$  are obtained from the following considerations. The interaction can occur along either of two potential energy curves, the  $2p\sigma(^2\Sigma_u^+)$  or the  $1s\sigma(^2\Sigma_g^+)$  (ref. 18). The  $2p\sigma(^2\Sigma_u^+)$  corresponds to a repulsive potential at all separations. The  $1s\sigma(^2\Sigma_g^+)$  corresponds to an attractive potential at large separations and to a repulsive potential at small separations (see ref. 18 for a discussion). For the  $1s\sigma(^2\Sigma_g^+)$  potential energy, it was found that the collision cross sections obtained for temperatures less than 15 000° K by using an exponential-attractive potential (a strictly attractive potential) were within 10 percent of those calculated by using a Morse potential (a potential that is attractive at large separations and repulsive at small separations). For higher temperatures they were always within a factor of 2 of the values obtained by using a Morse potential. Since for temperatures greater than 15 000° K, the concentration of neutral hydrogen atoms is negligible, only a small error will be introduced by using an exponential-attractive potential over the entire temperature range. Therefore, in the calculation of the collision integrals  $\Omega_{H-H^+}^{(2,2)}$ , the  $1s\sigma(^2\Sigma_g^+)$  potential was fitted with an exponential-attractive potential for values of separation distances from approximately 1 to 8 angstroms, and the  $2p\sigma(^2\Sigma_u^+)$  was fitted with an exponential-repulsive potential over the same separation distances. The results are

$$\varphi(r) = 9.5628 e^{-\frac{r}{1.022}}, \text{ eV} \quad \text{for } 1s\sigma(^2\Sigma_g^+)$$

$$\varphi(r) = -56.37 e^{-\frac{r}{0.5817}}, \text{ eV} \quad \text{for } 2p\sigma(^2\Sigma_u^+)$$

The data for both potentials were taken from references 19 and 20.

## Hydrogen Atom - Electron Collisions

The zeroth order singlet and triplet elastic phase shifts for monoenergetic e-H scattering processes are tabulated in reference 21. The singlet phase shift is used when the total spin of the incident and the atomic electron is zero, and the triplet phase shift is appropriate when the total spin of the incident and the atomic electron is 1. The monoenergetic collision cross section (eq. (9)) is given in terms of the zeroth order phase shift by the equation (see ref. 22)

$$Q^{(1)} = \frac{4\pi\hbar^2}{m^2g^2} \sin^2\delta_0$$

$$Q^{(2)} = \frac{8\pi\hbar^2}{3m^2g^2} \sin^2\delta_0$$

where  $\hbar$  is Planck's constant divided by  $2\pi$ , and  $\delta_0$  is the zeroth order phase shift. In the equations for the transport properties, the collision cross sections for singlet  $\delta_0^-$  and the triplet  $\delta_0^+$  phase shifts were weighted with their respective multiplicities. The multiplicity is equal to  $2S + 1$  where  $S = 0, 1$  for the singlet and triplet phase shifts, respectively. Therefore

$$\left. \begin{aligned} Q_{av}^{(1)} &= \frac{4\pi\hbar^2}{m^2g^2} \left( \frac{1}{4} \sin^2\delta_0^- + \frac{3}{4} \sin^2\delta_0^+ \right) \\ Q_{av}^{(2)} &= \frac{8\pi\hbar^2}{3m^2g^2} \left( \frac{1}{4} \sin^2\delta_0^- + \frac{3}{4} \sin^2\delta_0^+ \right) \end{aligned} \right\} \quad (13)$$

In order to perform the integration of equation (8) when equation (13) is substituted,  $\sin^2\delta_0^- + 3 \sin^2\delta_0^+$  was fitted with a fourth-degree polynomial in the velocity range from approximately  $3 \times 10^7$  to  $1.3 \times 10^8$  centimeters per second (temperature from approximately  $2000^\circ$  to  $40\,000^\circ$  K). The resulting polynomial was substituted in equation (8) and the integration performed to obtain  $\Omega_{H-e}^{(l,s)}$ . The results are given in appendix C.

## Hydrogen Ion - Hydrogen Ion, Hydrogen Ion - Electron, and Electron-Electron Collisions

The shielded coulomb potential as given in reference 23 was used for these interactions. The shielded coulomb potential is of the form

$$\phi = \frac{q}{r} e^{-r/h}$$

where  $h$  is the Debye length and  $q$  is the charge.

## CALCULATIONS

The viscosity, thermal conductivity, electrical conductivity, binary and multicomponent diffusion coefficients, and thermal diffusion coefficients were calculated for equilibrium atomic hydrogen at temperatures ranging from 5000° to 40 500° K and pressures from  $10^{-5}$  to  $10^2$  atmospheres. The degree of ionization needed for calculating the mole fractions was obtained from

$$\beta = \sqrt{\frac{K_1}{p + K_1}}$$

where  $K_1$ , the ionization equilibrium constant, was taken from reference 9.

The equations used for calculating the transport properties are given in appendix B. The calculations were performed on an IBM 7094 computing machine.

## RESULTS AND DISCUSSION

Listed in table I are the collision cross sections and the quantities  $A^*$ ,  $B^*$ , and  $C^*$  that depend on temperature only. Table II and figures 3 to 10 present the transport properties for pressures from  $10^{-5}$  to  $10^2$  atmospheres in 500° K temperature intervals from 5000° to 40 500° K. Also in table II, the shielded coulombic collision cross sections  $\bar{\Omega}_c^{(l,s)}$  and the quantities  $A^*$ ,  $B^*$ , and  $C^*$  for the shielded coulombic potential are presented. These quantities depend on temperature and pressure since they are a function of the Debye shielding length, which is a function of the charged particle density.

Figure 3 shows the product of the pressure and binary diffusion coefficient as a function of temperature and pressure. From figures 3(a) and (c), this product for the atom-ion and the atom-electron becomes more independent of pressure as the temperature increases.

Figure 4 illustrates the variation of the product of the pressure and multicomponent diffusion coefficients with temperature and pressure. A comparison of the product  $pD_{H+-H}$  (fig. 4(e)) with the product  $pD_{H-H+}$  (fig. 4(f)) reveals that these two coefficients are approximately equal for all pressures. Also from figures 4(e) and (f), the products  $pD_{H+-H}$  and  $pD_{H-H+}$  are independent of pressure.

Figure 5 shows the thermal diffusion coefficient as a function of temperature and pressure. Figure 5(a) shows that the atomic hydrogen coefficient  $D_{H}^{T}$  is negative for all temperatures shown. (Negative values indicate that the particle tends to move toward the warmer region.) Therefore, in a physical system, the diffusion of hydrogen atoms caused by a temperature gradient is in the same direction as the diffusion of the hydrogen atoms caused by a concentration gradient. This is just the opposite of atomic hydrogen thermal diffusion at the low temperatures, where ionization was not important (ref. 1).

Figures 5(b) and (c) show that the electron thermal diffusion coefficient is positive for all temperatures and pressures studied and that the hydrogen

ion thermal diffusion coefficient is positive at the lower temperatures and becomes negative at the higher temperatures. Hence, the electron thermal diffusion is in the same direction as the concentration diffusion, and the hydrogen ion thermal diffusion is in the same direction as the concentration diffusion at the lower temperatures and opposite at the higher temperatures.

The condition that

$$\sum_i n_i m_i \langle \vec{V}_i \rangle = 0$$

implies from equation (1) that

$$D_H^T + D_{H^+}^T + D_e^T = 0$$

which is substantiated in table II and figure 5.

A comparison of the values of the thermal diffusion coefficients reveals that, up to a high degree of ionization (mole fraction of ions,  $x_{H^+} \lesssim 0.40$ ),  $D_H^T$  is approximately equal to  $-D_{H^+}^T$ . Therefore, the diffusive motion of the ions and atoms is almost independent of the diffusive motion of the electron. This is a result of the small mass of the electron in comparison with the mass of the ion and atom.

Figures 6 and 7 show the variation of the viscosity coefficient and the translational thermal conductivity, respectively, with temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres. From these figures it is seen that, except for conductivity corresponding to a pressure of  $10^2$  atmospheres, these two quantities first decrease to a minimum and then increase monotonically with temperature. The reason for the variation may be explained as follows: These quantities vary inversely with the collision cross sections. As the temperature increases, there is a transition from a gas composed of all neutral species to a gas composed of all charged species. Correspondingly, the collision cross sections of the gas change from the relatively small values corresponding to neutral particle collisions to the relatively large values corresponding to charged particle collisions. For pressures less than  $10^2$  atmospheres, the transition occurs rapidly enough to cause both the viscosity and frozen thermal conductivity to decrease as the temperature increases even though the neutral and the coulombic collision cross sections decreased with increasing temperature.

Figure 8 shows the variation of  $\lambda_d$  with temperature and pressures. It is seen that this quantity is always less than 6 percent of the total thermal conductivity.

Figure 9 shows the variation of the total thermal conductivity with temperature for the same pressures. Ionization causes the total thermal conductivity to rise sharply with temperature and to have very pronounced peaks. The peaks occur where the quantity  $T(\partial K_1/\partial T)$  reaches a maximum and tend to broaden as the pressure increases. The electrical conductivity is shown as a function of temperature and pressure in figure 10.

## Comparison With Previous Results

Yos (ref. 5) calculated the thermal conductivity, viscosity coefficient, the electrical conductivity of equilibrium hydrogen, and the H-e<sup>-</sup> and H-H<sup>+</sup> binary diffusion coefficient for pressures of 1, 3, 10, and 30 atmospheres for temperatures up to 30 000° K. These calculations are the only other calculations of the transport properties of partially ionized hydrogen known to the author.

Figure 11 shows a comparison of the present results for the electrical conductivity with those of reference 5 for a pressure of 1 atmosphere. Also shown at a temperature of 30 000° K is the value obtained by using the Spitzer equation (ref. 24) for the electrical conductivity of a completely ionized gas. At a temperature of 30 000° K, the present results are larger than those obtained from the Spitzer equation by approximately 10 percent and larger than those of Yos by approximately 17 percent. The agreement with the present results is reasonable considering the difference in the method of obtaining them.

In reference 5, the first approximation equation (eq. (B18)) was used to calculate the electrical conductivity, and the coulombic collision cross sections were adjusted so that the results agreed as closely as possible with the results obtained by using the Spitzer equation when the gas was completely ionized. As shown in figure 12, these coulombic collision cross sections are lower than the shielded coulombic collision cross sections used in this report. Since the electrical conductivity varies inversely with the collision cross section, the lower values of electrical conductivity obtained in reference 5 can only be attributed to his use of only the first approximation equation.

In figures 13 and 14 are presented comparisons of the values for the translational thermal conductivity and the viscosity, respectively. The present results agree approximately with the result of reference 5 for temperatures less than 10 000° K but are lower for all higher temperatures. The differences are again attributable to the use in reference 5 of less rigorous equations and lower collision cross sections. From the equations in appendix B, the viscosity and translational thermal conductivity vary inversely with the collision cross sections, which are in the correct direction to account partly for the observed difference.

A comparison of the atom-electron and the atom-ion binary diffusion coefficients of the present calculations with the values presented in reference 5 is given in figure 15. The larger values obtained for the present calculations are primarily a result of the use of the second approximation (rather than the first) approximation.

## APPENDIX A

### SYMBOLS

A	constant in exponential potential energy ( $\phi = Ae^{-r/\rho}$ ), eV
$A^*, B^*, C^*$	ratio of collision integrals that appear in expression for transport properties of mixtures (eqs. (B3), (B7), and (B8))
b	impact parameter, cm
$D_{ij}$ , $D(i-j)$ , or $D_M$	multicomponent diffusion coefficient of $i^{\text{th}}$ through $j^{\text{th}}$ species, $\text{cm}^2/\text{sec}$
$D_i^T$	thermal diffusion coefficient of $i^{\text{th}}$ species, $\text{g}/(\text{cm})(\text{sec})$
$\mathcal{D}_{ij}$	binary diffusion coefficient between $i^{\text{th}}$ and $j^{\text{th}}$ species, $\text{cm}^2/\text{sec}$
$\vec{d}_j$	defined by eq. (2)
E	relative energy, ergs
$\vec{E}$	electric field
$\vec{E}_s$	charge separation field
e	charge of electron, statcoulombs
g	initial relative velocity of colliding particles, $\text{cm}/\text{sec}$
$\Delta H$	heat of reaction, $\text{cal}/\text{mole}$
h	Debye distance, cm
$\hbar$	Planck's constant divided by $2\pi$ , $(\text{erg})(\text{sec})$
$\vec{J}$	total current
$K_i$	ionization equilibrium constant, atm
k	Boltzmann constant
$M_i$	molecular weight of $i^{\text{th}}$ species, $\text{g}/\text{mole}$
$m_i$	mass of $i^{\text{th}}$ particle, g

$m$	mass of electron, g
$n$	total number of particle per unit volume, $\text{cm}^{-3}$
$n_i$	number of $i^{\text{th}}$ particles per unit volume, $\text{cm}^{-3}$
$\tilde{P}$	pressure tensor
$p$	pressure, atm
$Q_{\text{ex}}$	monoenergetic collision cross section for charge exchange, $\text{\AA}^2$
$Q_{ij}^{(l)}$	monoenergetic collision cross section, $\text{\AA}^2$
$q$	charge of ion, statcoulombs
$\vec{q}$	total energy flux per unit area, $\text{cal}/(\text{cm}^2)(\text{sec})$
$R$	universal gas constant
$r$	separation distance between colliding particles, $\text{\AA}$
$\frac{\partial}{\partial r}$	symbol for the gradient operator del $\nabla$ , $\text{cm}^{-1}$
$\tilde{S}$	rate of shear tensor
$T$	temperature, $^{\circ}\text{K}$
$\tilde{U}$	unit tensor
$\langle V_i \rangle$	diffusion velocity of $i^{\text{th}}$ species, $\text{cm}/\text{sec}$
$\vec{X}_i$	external force acting on $i^{\text{th}}$ species
$x_i$	mole fraction of $i^{\text{th}}$ species
$Z$	compressibility factor, $pV/RT$ , where $V$ is volume
$\alpha$	coefficient of temperature gradient term in current equation (eq. (6))
$\beta$	degree of ionization
$v_{ij}$	reduced initial velocity between $i^{\text{th}}$ and $j^{\text{th}}$ colliding particles, $\left( \sqrt{\mu_{ij}/2kT} \right) g$
$\Delta_c$	$\frac{1}{1 - \Delta_c}$ is second-approximation correction term for electrical conductivity

$\Delta_{ij}$	$\frac{1}{1 - \Delta_{ij}}$ is second approximation correction term for binary diffusion coefficient
$\delta_0$	zeroth order phase shift angle
$\delta_0^+$	triplet zeroth order phase shift angle
$\delta_0^-$	singlet zeroth order phase shift angle
$\eta$	viscosity coefficient, g/(cm)(sec)
$\lambda$	total thermal conductivity of gas mixture, cal/(cm)(sec)(°K)
$\lambda_d$	defined by eq. (4)
$\lambda_r$	reaction contribution to thermal conductivity, cal/(cm)(sec)(°K)
$\lambda_t$	translational contribution to thermal conductivity, cal/(cm)(sec)(°K)
$\mu_{ij}$	reduced mass of i-j species
$\nu$	total number of different species contained in gas
$\rho$	density, g/cm <sup>3</sup>
$\sigma$	electrical conductivity, mhos/m
$\phi(r)$	interaction potential energy, eV
$\chi$	angle of deflection between relative velocity vectors of two colliding particles before and after collision
$\Omega_{ij}^{(l,s)}$	collision integral between i <sup>th</sup> and j <sup>th</sup> particles (l,s are dummy indices), cm <sup>5</sup> /sec
$\bar{\Omega}_{ij}^{(l,s)}$	average collision cross section for i <sup>th</sup> and j <sup>th</sup> particles (l,s are dummy indices), Å <sup>2</sup>

APPENDIX B

EQUATIONS FOR TRANSPORT COEFFICIENT

In the following equations the subscripts 1, 2, and 3 denote the neutral hydrogen atom, the atomic hydrogen ion, and electrons, respectively:

$$\begin{aligned} \eta_{ij} &= \eta_{ji} & A_{ij}^* &= A_{ji}^* & B_{ij}^* &= B_{ji}^* \\ C_{ij}^* &= C_{ji}^* & \mathcal{D}_{ij} &= \mathcal{D}_{ji} & \lambda_{ij} &= \lambda_{ji} \end{aligned}$$

Viscosity

The equations for the first approximation to the viscosity is (ref. 11, eq. (8) 2-28)

$$\eta = \sum_{i=1}^3 \frac{x_i^2}{H_{ii}} - \sum_{i=1}^3 \sum_{\substack{j=1 \\ j \neq i}}^3 \frac{x_i x_j H_{ij}}{H_{ii} H_{jj}} + \sum_{i=1}^3 \sum_{\substack{j=1 \\ j \neq i}}^3 \sum_{\substack{k=1 \\ k \neq i}}^3 \frac{x_j x_k H_{ij} H_{ik}}{H_{ii} H_{jj} H_{kk}} \quad (B1)$$

where

$$H_{11} = \frac{x_1^2}{\eta_1} + \frac{2x_1 x_2}{\eta_{12}} \frac{M_1 M_2}{(M_1 + M_2)^2} \left( \frac{5}{3A_{12}^*} + \frac{M_2}{M_1} \right) + \frac{2x_1 x_3}{\eta_{13}} \frac{M_1 M_3}{(M_1 + M_3)^2} \left( \frac{5}{3A_{13}^*} + \frac{M_3}{M_1} \right)$$

$$H_{22} = \frac{x_2^2}{\eta_2} + \frac{2x_2 x_1}{\eta_{21}} \frac{M_2 M_1}{(M_1 + M_2)^2} \left( \frac{5}{3A_{21}^*} + \frac{M_1}{M_2} \right) + \frac{2x_2 x_3}{\eta_{23}} \frac{M_3 M_2}{(M_2 + M_3)^2} \left( \frac{5}{3A_{23}^*} + \frac{M_3}{M_2} \right)$$

$$H_{33} = \frac{x_3^2}{\eta_3} + \frac{2x_3 x_1}{\eta_{31}} \frac{M_3 M_1}{(M_3 + M_1)^2} \left( \frac{5}{3A_{31}^*} + \frac{M_1}{M_3} \right) + \frac{2x_3 x_2}{\eta_{32}} \frac{M_3 M_2}{(M_3 + M_2)^2} \left( \frac{5}{3A_{32}^*} + \frac{M_2}{M_3} \right)$$

$$H_{12} = H_{21} = - \frac{2x_1 x_2}{\eta_{12}} \frac{M_1 M_2}{(M_1 + M_2)^2} \left( \frac{5}{3A_{12}^*} - 1 \right)$$

$$H_{13} = H_{31} = - \frac{2x_1 x_3}{\eta_{13}} \frac{M_1 M_3}{(M_1 + M_3)^2} \left( \frac{5}{3A_{13}^*} - 1 \right)$$

$$H_{23} = H_{32} = - \frac{2x_2 x_3}{\eta_{23}} \frac{M_2 M_3}{(M_2 + M_3)^2} \left( \frac{5}{3A_{23}^*} - 1 \right)$$

The molecular weight of the hydrogen ion is approximately equal to the molecular weight of the hydrogen atom, therefore  $M_2 \approx M_1$ . Also the mass of the electron is much less than the mass of the ion and atom ( $M_3/M_2 \approx M_3/M_1 \ll 1$ ). With these approximations, equation (B1) becomes

$$\eta_{\text{mix}} = \frac{x_1^2}{H_{11}} + \frac{x_2^2}{H_{22}} + \frac{x_3^2}{H_{33}} - \frac{2x_2x_1H_{12}}{H_{11}H_{22}} + \frac{x_2^2H_{12}^2}{H_{11}H_{22}^2} + \frac{x_1^2H_{12}^2}{H_{11}^2H_{22}} \quad (\text{B2})$$

where

$$H_{11} = \frac{x_1^2}{\eta_1} + \frac{x_1x_2}{2\eta_{12}} \left( \frac{5}{3A_{12}^*} + 1 \right)$$

$$H_{22} = \frac{x_2^2}{\eta_2} + \frac{x_1x_2}{2\eta_{21}} \left( \frac{5}{3A_{21}^*} + 1 \right)$$

$$H_{33} = \frac{x_3^2}{\eta_3} + \frac{2x_3x_1}{\eta_{31}} + \frac{2x_3x_2}{\eta_{32}}$$

$$H_{12} = \frac{-x_1x_2}{2\eta_{12}} \left( \frac{5}{3A_{12}^*} - 1 \right)$$

$$H_{13} \approx 0$$

$$H_{23} \approx 0$$

$$A_{ij}^* \equiv \frac{\bar{\Omega}_{ij}(2,2)}{\bar{\Omega}_{ij}(1,1)} \quad i = 1, 2, 3, \text{ and } j = 1, 2, 3 \quad (\text{B3})$$

$$\eta_i = 266.93 \times 10^{-7} \frac{\sqrt{M_i T}}{\bar{\Omega}_{ii}(2,2)} \quad (\text{B4})$$

$$\eta_{ij} = 266.93 \times 10^{-7} \frac{\sqrt{\frac{2M_i M_j T}{M_i + M_j}}}{\bar{\Omega}_{ij}(2,2)} \quad (\text{B5})$$

## Binary Diffusion Coefficients

The second approximation to the binary diffusion coefficient is (ref. 11, eq. (8.2-47) and (8.A-4)).

$$D_{ij} = 0.002628 \frac{\sqrt{\frac{T^3(M_i + M_j)}{2M_i M_j}}}{p\bar{\Omega}_{ij}(1,1)} \left( \frac{1}{1 - \Delta_{ij}} \right) \quad (B6)$$

$$\Delta_{ij} = \frac{(6C_{ij}^* - 5)^2}{60(X_\lambda - Y_\lambda)} W$$

$$W = \frac{x_i^2 \left( \frac{M_i}{M_j} \right)}{\lambda_i \left( \frac{M_j}{M_i} \right)} + \frac{2x_i x_j}{\lambda_{ij}} \left[ 1 + \frac{15}{8A_{ij}^*} \frac{(M_i - M_j)^2}{M_i M_j} \right] + \frac{x_j^2 \left( \frac{M_j}{M_i} \right)}{\lambda_j \left( \frac{M_i}{M_j} \right)}$$

$$X_\lambda = \frac{x_i^2}{\lambda_i} + \frac{2x_i x_j}{\lambda_{ij}} + \frac{x_j^2}{\lambda_j}$$

$$Y_\lambda = \frac{x_i^2}{\lambda_i} U^{(1)} + \frac{2x_i x_j}{\lambda_{ij}} U^{(Y)} + \frac{x_j^2}{\lambda_j} U^{(2)}$$

$$U^{(1)} = \frac{4}{15} A_{ij}^* - \frac{1}{12} \left( \frac{12}{5} B_{ij}^* + 1 \right) \frac{M_i}{M_j} + \frac{1}{2} \frac{(M_i - M_j)^2}{M_i M_j}$$

$$U^{(Y)} = \frac{4}{15} A_{ij}^* \left[ \frac{(M_i + M_j)^2}{4M_i M_j} \right] \frac{\lambda_{ij}^2}{\lambda_i \lambda_j} - \frac{1}{12} \left( \frac{12}{5} B_{ij}^* + 1 \right) - \frac{5}{32A_{ij}^*} \left( \frac{12}{5} B_{ij}^* - 5 \right) \frac{(M_i - M_j)^2}{M_i M_j}$$

$$U^{(2)} = \frac{4}{15} A_{ij}^* - \frac{1}{12} \left( \frac{12}{5} B_{ij}^* + 1 \right) \frac{M_j}{M_i} + \frac{1}{2} \frac{(M_i - M_j)^2}{2M_i M_j}$$

$$B_{ij}^* \equiv \frac{5\bar{\Omega}_{ij}(1,2) - 4\bar{\Omega}_{ij}(1,3)}{\bar{\Omega}_{ij}(1,1)} \quad (B7)$$

$$C_{ij}^* \equiv \frac{\bar{\Omega}_{ij}(1,2)}{\bar{\Omega}_{ij}(1,1)} \quad (B8)$$

$A_{ij}^*$  is given by equation (B3) and the pure gas thermal conductivities are

$$\lambda_1 = 1989.1 \times 10^{-7} \frac{\sqrt{\frac{T}{M_1}}}{\bar{\Omega}_{ii}(2,2)} \quad (B9)$$

$$\lambda_{ij} = 1989.1 \times 10^{-7} \frac{\sqrt{\frac{T(M_1 + M_j)}{2M_i M_j}}}{\bar{\Omega}_{ij}(2,2)} \quad (B10)$$

### Thermal Conductivity

The total thermal conductivity  $\lambda$  may be written as the sum of three terms

$$\lambda = \lambda_t + \lambda_d + \lambda_r \quad (B11)$$

where  $\lambda_t$  is the translational contribution,  $\lambda_d$  is the diffusional contribution, and  $\lambda_r$  is the reaction contribution including thermal diffusion and the charge separation field.

The second-approximation equation for the sum of the translational and diffusional contributions is (ref. 25)

$$\lambda_t = 4 \frac{\begin{vmatrix} L_{11} & L_{12} & L_{13} & x_1 \\ L_{21} & L_{22} & L_{23} & x_2 \\ L_{31} & L_{32} & L_{33} & x_3 \\ x_1 & x_2 & x_3 & 0 \end{vmatrix}}{\begin{vmatrix} L_{11} & L_{12} & L_{13} \\ L_{21} & L_{22} & L_{23} \\ L_{31} & L_{32} & L_{33} \end{vmatrix}} \quad (B12)$$

where

$$L_{ii} = -\frac{4x_i^2}{\lambda_i} - \frac{16T}{25p} \sum_{\substack{k=1 \\ k \neq i}}^3 \frac{x_i x_k \left( \frac{15}{2} M_i^2 + \frac{25}{4} M_k^2 - 3M_{ik}^2 B_{ik}^* + 4M_i M_k A_{ik}^* \right)}{(M_i + M_k)^2 \mathcal{Q}_{ik}} \quad (B13)$$

$$L_{ij}(i \neq j) = \frac{16T}{25p} \frac{x_i x_j M_i M_j \left( \frac{55}{4} - 3B_{ij}^* - 4A_{ij}^* \right)}{(M_i + M_j)^2 \mathcal{D}_{ij}} \quad (\text{B14})$$

$\mathcal{D}_{ij}$  are the binary diffusion coefficients given in equation (B6) and  $A_{ij}^*$  and  $B_{ij}^*$  are given by equations (B3) and (B7), respectively.

The equation for  $\lambda_d$  is given by equation (4) from reference 7

$$\lambda_d = \left[ \frac{x_1 k T D_{12} D_3^T}{(x_3 + x_1) m D_{32}} \right] \left( \frac{\partial \ln K_i}{\partial T} \right) \quad (\text{B15})$$

where  $K_i$  is the ionization equilibrium constant,  $k$  is the Boltzmann constant,  $m$  is the electron mass,  $D_3^T$  is the electron thermal diffusion coefficient, and  $D_{12}$  and  $D_{32}$  are the atom-ion and the electron-ion multicomponent diffusion coefficients.

The equation for the reaction contribution to the total thermal conductivity is (refs. 6 and 7)

$$\lambda_r = \frac{p \frac{(\Delta H)^2}{RT^2}}{RT \left[ \frac{(x_2 + x_1)^2}{x_1 x_2 D_{12}} + \frac{(x_3 + x_1)^2}{x_3 x_1 D_{13}} \right]} \quad (\text{B16})$$

Since  $x_2 = x_3$

$$\lambda_r = \left( \frac{\Delta H}{RT} \right)^2 \frac{p x_1 x_2}{(x_1 + x_2)^2 T \left( \frac{1}{D_{12}} + \frac{1}{D_{13}} \right)} \quad (\text{B17})$$

where  $D_{12}$  and  $D_{13}$  are the atom-ion and atom-electron multicomponent diffusion coefficients, respectively.

#### Multicomponent and Thermal Diffusion Coefficients

The second-approximation equation for the multicomponent  $D_{hk}$  and thermal diffusion coefficients  $D_k^T$  are, respectively, (ref. 4)

$$D_{nk} = \frac{3\sigma_{1n}^2}{2m_k} \sqrt{\frac{2\pi k \Gamma}{m_n}} \frac{1}{|q|} \begin{vmatrix} q_{1j}^{00} & q_{1j}^{01} & (\delta_{1k} - \delta_{1k'}) \\ q_{1j}^{10} & q_{1j}^{11} & 0 \\ \delta_{jn} & 0 & 0 \end{vmatrix} \quad (B18)$$

and

$$D_k^T = \frac{15}{4} \frac{\sqrt{2\pi m_k k \Gamma}}{|q|} \begin{vmatrix} q_{1j}^{00} & q_{1j}^{01} & 0 \\ q_{1j}^{10} & q_{1j}^{11} & n_1 \\ \delta_{kj} n_j & 0 & 0 \end{vmatrix} \quad (B19)$$

where  $|q|$  is the determinant formed from the numerator by deleting the last row and the last column. The symbols  $q_{1j}^{00}$ ,  $q_{1j}^{01}$ ,  $q_{1j}^{10}$ , and  $q_{1j}^{11}$  represent blocks of elements with both  $i$  and  $j$  ranging from 1 to 3. The expressions for the  $q_{1j}$ 's are as follows:

$$q_{1j}^{00} = 8 \sum_{l=1}^3 \frac{n_l m_l^{1/2}}{(m_1 + m_l)^{1/2}} \pi \bar{\Omega}_{il}^{(1,1)} \left[ n_1 \sqrt{\frac{m_l}{m_j}} (\delta_{1j} - \delta_{jl}) - n_j \frac{\sqrt{m_l m_j}}{m_1} (1 - \delta_{1l}) \right] \quad (B20)$$

$$q_{1j}^{01} = 8n_1 \left( \frac{m_1}{m_j} \right)^{3/2} \sum_{l=1}^3 \frac{n_l m_l^{3/2}}{(m_1 + m_l)^{3/2}} \pi \left[ \frac{5}{2} \bar{\Omega}_{il}^{(1,1)} - 3\bar{\Omega}_{il}^{(1,2)} \right] (\delta_{1j} - \delta_{jl}) \quad (B21)$$

$$q_{1j}^{10} = \begin{pmatrix} m_j \\ m_1 \end{pmatrix} q_{1j}^{01} \quad (B22)$$

$$q_{1j}^{11} = 8n_1 \left( \frac{m_1}{m_j} \right)^{3/2} \sum_{l=1}^3 \frac{\pi n_l m_l^{1/2}}{(m_1 + m_l)^{5/2}} \left\{ (\delta_{1j} - \delta_{jl}) \left[ \frac{5}{4} (6m_j^2 + 5m_l^2) \bar{\Omega}_{il}^{(1,1)} - 15m_l^2 \bar{\Omega}_{il}^{(1,2)} \right] \right. \\ \left. + 12m_l^2 \bar{\Omega}_{il}^{(1,3)} \right\} + (\delta_{1j} + \delta_{jl}) 4m_j m_l \bar{\Omega}_{il}^{(2,2)} \quad (B23)$$

where  $\delta_{ij}$  is the Kronecker delta; that is,

$$\begin{aligned}\delta_{ij} &= 1 && \text{if } j = i \\ &= 0 && \text{if } j \neq i\end{aligned}$$

### Electrical Conductivity

The equation for the second approximation for the electrical conductivity is (ref. 26)

$$\sigma = \frac{\sigma_0}{1 - \Delta_c} \quad (\text{B24})$$

where  $\sigma_0$  is the first approximation to the electrical conductivity and  $\Delta_c$  is the second approximation correction factor:

$$\sigma_0 = \frac{3x_3 e^2}{16} \sqrt{\frac{2}{\pi m_e kT}} \frac{1}{\left[ x_3 \bar{\Omega}_{23}^{(1,1)} + x_1 \bar{\Omega}_{13}^{(1,1)} \right]} \quad (\text{B25})$$

$$\Delta_c = \frac{5A^2}{2A_0 A_2}$$

$$A_0 = x_2^4 \sqrt{\pi} \bar{\Omega}_{23}^{(1,1)} + x_1^4 \sqrt{\pi} \bar{\Omega}_{13}^{(1,1)}$$

$$A_1 = x_2 Z_{23}^4 \sqrt{\pi} \bar{\Omega}_{23}^{(1,1)} + x_1 Z_{13}^4 \sqrt{\pi} \bar{\Omega}_{13}^{(1,1)}$$

$$A_2 = x_2 \left[ Y_{13}^4 \sqrt{\pi} \bar{\Omega}_{23}^{(1,1)} + 0.2 \sqrt{2} Z_{33}^{11} \sqrt{\pi} \bar{\Omega}_{33}^{(1,1)} \right] + x_1 Y_{13}^4 \sqrt{\pi} \bar{\Omega}_{13}^{(1,1)}$$

where  $e$  is the electronic charge

$$Z_{ij} = 1 - \frac{6}{5} C_{ij}^*$$

$$Z_{33}^{11} = 2A_{33}^*$$

$$Y_{ij} = 2.5 - \frac{6}{5} B_{ij}^*$$

and  $\bar{\Omega}_{ij}^{(1,1)}$  are the collision cross sections given in equation (7). Subscripts 1, 2, and 3 refer to neutral atom, ion, and electron, respectively. The value of  $\Delta_c$  is given in table II.

APPENDIX C

EXPRESSIONS FOR HYDROGEN ATOM - HYDROGEN ION AND HYDROGEN

ATOM - ELECTRON COLLISIONS INTEGRALS

Hydrogen Atom - Hydrogen Ion Collision Integral

As stated in the text, the collision integral  $\Omega^{(1,s)}$  is given approximately by

$$\begin{aligned}\Omega^{(1,s)} &= 2\Omega_{ex}^{(1,s)} \\ &= 2\sqrt{\frac{kT}{2\mu\pi}} \int_0^\infty e^{-r^2} r^{(2s+3)} Q_{ex}^{(1)} dr\end{aligned}\quad (C1)$$

where the second expression in equation (C1) is obtained by using equation (8). The monoenergetic collision cross section  $Q_{ex}^{(1)}$  was calculated from reference 17, and then fitted to the expression

$$Q_{ex}^{(1)} = (B - C \ln E)^2 \quad (C2)$$

where  $B = 5.44$ ,  $C = 0.4442$ , and  $E$  is the relative energy in ergs before the collision.

In order to perform the integration of equation (C1),  $r$  is expressed in terms of the relative energy  $E$ . Since  $g$  is the relative velocity, the relative energy is

$$E = \frac{1}{2} \mu g^2$$

Therefore,

$$r = \sqrt{\frac{\mu}{2kT}} g = \sqrt{\frac{E}{kT}} \quad (C3)$$

$$dr = \frac{1}{2} \frac{dE}{\sqrt{kTE}} \quad (C4)$$

Substituting equations (C3) and (C4) into equation (C1) yields

$$\Omega^{(1,s)} = \frac{1}{2} \sqrt{\frac{2kT}{\pi\mu}} (kT)^{-(s+2)} \int_0^{\infty} e^{-\frac{E}{kT}} Q_{\text{ex}}^{(1)} E^{(s+1)} dE \quad (C5)$$

Then substituting equation (C2) into equation (C5) and integrating give

$$\left. \begin{aligned} \Omega^{(1,1)} &= \frac{1}{2} \sqrt{\frac{2kT}{\pi\mu}} \left[ 2(B - C \ln kT)^2 - 3.691 C(B - C \ln kT) + 2.484 C^2 \right] \\ \Omega^{(1,2)} &= \frac{1}{2} \sqrt{\frac{2kT}{\pi\mu}} \left[ 6(B - C \ln kT)^2 - 15.07 C(B - C \ln kT) + 11.16 C^2 \right] \\ \Omega^{(1,3)} &= \frac{1}{2} \sqrt{\frac{2kT}{\pi\mu}} \left[ 24(B - C \ln kT)^2 - 72.3 C(B - C \ln kT) + 59.75 C^2 \right] \end{aligned} \right\} \quad (C6)$$

The integrals were evaluated by using the tables of reference 27.

#### Hydrogen Atom - Electron Collision Integral

The collision integral is given in terms of the monoenergetic cross section by equation (8)

$$\Omega^{(l,s)} = \sqrt{\frac{kT}{2\pi\mu}} \int_0^{\infty} e^{-\gamma^2} \gamma^{(2s+3)} Q^{(l)} d\gamma \quad (8)$$

For H-e collisions, the monoenergetic collision cross sections  $Q^{(1)}$  are given in terms of their phase shift angle by

$$Q^{(1)} = \frac{\pi\hbar^2}{m^2 g^2} (\sin^2 \delta_0^- + 3 \sin^2 \delta_0^+) \quad (C7)$$

$$Q^{(2)} = \frac{2\pi\hbar^2}{3m^2 g^2} (\sin^2 \delta_0^- + 3 \sin^2 \delta_0^+)$$

where  $\delta_0^+$  and  $\delta_0^-$  are the triplet and singlet phase shift angles, respectively, and  $g$  is approximately the velocity of the electron. Values of  $\delta_0^+$  and  $\delta_0^-$  are given in reference 21 in terms of the velocity of the electron.

In order to perform the integration of equation (7) when equation (C7) is substituted into it, the quantity  $\sin^2 \delta_0^- + 3 \sin^2 \delta_0^+$  was fitted to a fourth-degree polynomial in the velocity. The fit gave

$$\begin{aligned} \sin^2 \delta_0^- + 3 \sin^2 \delta_0^+ &= -2.30975 \times 10^{-1} + 2.72458 \times 10^{-8} g + 3.25887 \times 10^{-16} g^2 \\ &\quad - 3.9323 \times 10^{-24} g^3 + 1.1137 \times 10^{-32} g^4 \end{aligned} \quad (C8)$$

where  $g$  is in centimeters per second.

Substituting  $\gamma = \sqrt{\frac{\mu}{2kT}} g$  and equation (C8) into equation (8) results in

$$\Omega(1,s) = \frac{1}{2\sqrt{\pi}} \left(\frac{\mu}{2kT}\right)^{\frac{2s+3}{2}} \sum_{j=0}^4 \left(\frac{\pi \hbar^2 A_j}{m^2}\right) \int_0^{\infty} g^{2s+j+1} e^{-\frac{\mu g^2}{2kT}} dg \quad (C9)$$

$$\Omega(2,s) = \frac{1}{3\sqrt{\pi}} \left(\frac{\mu}{2kT}\right)^{\frac{2s+3}{2}} \sum_{j=0}^4 \left(\frac{\pi \hbar^2 A_j}{m^2}\right) \int_0^{\infty} g^{2s+j+1} e^{-\frac{\mu g^2}{2kT}} dg \quad (C10)$$

where the  $A_j$ 's are the coefficients of the  $g$ 's in equation (C8).

The result of integrating equation (C9) can be written as

$$\Omega(1,s) = \sum_{j=0}^4 \Omega_j(1,s) \quad (C11)$$

where

$$\Omega_j(1,s) = \begin{cases} \frac{\pi}{2} \left(\frac{\mu}{2kT}\right)^{\frac{1-j}{2}} \left(\frac{\hbar^2 A_j}{m^2}\right) \frac{1 \cdot 3 \cdot 5 \dots (j+2s)}{\left(\frac{j+2s+3}{2}\right)} & \text{for } j \text{ odd} \\ \frac{\sqrt{\pi}}{4} \left(\frac{\mu}{2kT}\right)^{\frac{1-j}{2}} \left(\frac{\hbar^2 A_j}{m^2}\right) \left(\frac{j+2s}{2}\right)! & \text{for } j \text{ even} \end{cases} \quad (C12)$$

Integration of equation (C10) yields

$$\Omega(2,s) = \frac{2}{3} \Omega(1,s) \quad (C13)$$

\*C14 UNITS, EGT.

Figure 1. - Illustration of overlap of dissociation and ionization reactions at high temperatures. Region I bounding curve represents area where  $x_{H_2} \geq 5 \times 10^{-4}$ . Region II bounding curve represents area where  $x_{H^+} \geq 5 \times 10^{-4}$ .

Figure 2. - Illustration of how reference 1 data may be faired into present results. Data for dashed curve was calculated by incorporating both dissociation and ionization. Pressure,  $10^2$  atmospheres.

Figure 3. - Product of pressure and binary diffusion coefficient of hydrogen as function of temperature for pressures of  $10^{-5}$  to  $10^2$  atmospheres.

(b) Hydrogen ion - electron.  
Figure 3. - Continued.

(c) Hydrogen atom - electron.

Figure 3. - Concluded.

(a) Hydrogen ion - electron.

Figure 4. - Product of pressure and multicomponent diffusion coefficient of hydrogen as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

(b) Electron - hydrogen ion.  
Figure 4. - Continued.

(c) Electron - hydrogen atom.

Figure 4. - Continued.

(d) Hydrogen atom - electron.

Figure 4. - Continued.

(e) Hydrogen ion - hydrogen atom.

Figure 4. - Continued.

(f) Hydrogen atom - hydrogen ion.

Figure 4. - Concluded.

(a) Atomic hydrogen.

Figure 5. - Thermal diffusion coefficient of atomic hydrogen as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

(b) Electron.

Figure 5. - Continued.

(c) Hydrogen ion.

Figure 5. - Continued.

(c) Concluded.

Figure 5. - Concluded.

Figure 6. - Viscosity of hydrogen as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

Figure 7. - Translational contribution to total thermal conductivity of hydrogen as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

Figure 8. - Contribution  $\lambda_D$  to total thermal conductivity as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

Figure 9. - Total thermal conductivity as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

Figure 10. - Electrical conductivity of ionizing atomic hydrogen as function of temperature for pressures from  $10^{-5}$  to  $10^2$  atmospheres.

Figure 11. - Comparison of present calculation of electrical conductivity of hydrogen with that of reference 5. Pressure, 1 atmosphere.

Figure 12. - Comparison of coulombic collision cross sections used in present calculations with those of Yos (ref. 5).

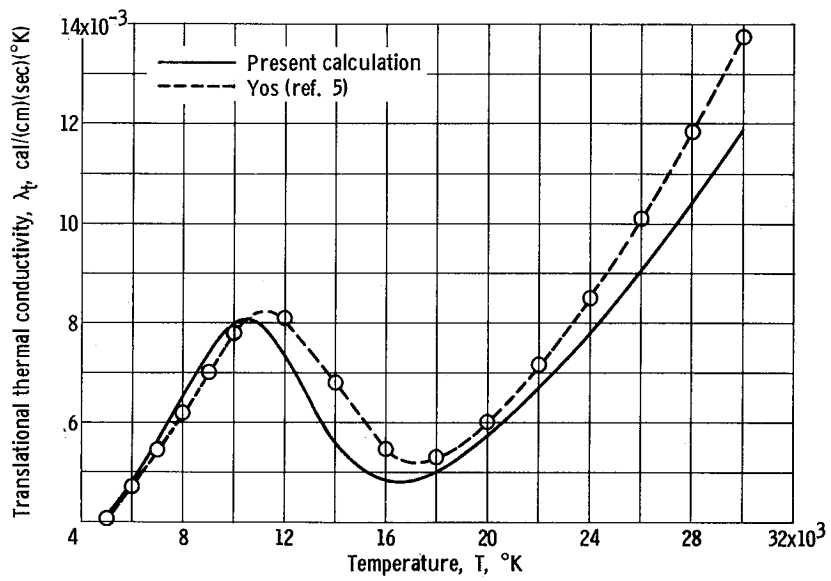

Figure 13. - Comparison of translational thermal conductivity of present calculation with that of reference 5. Pressure, 1 atmosphere.

Figure 14. - Comparison of viscosity of present calculation with that of reference 5. Pressure, 1 atmosphere.

Figure 15. - Comparison of atom-ion and atom-electron binary diffusion coefficients of present calculation with those of reference 5. Pressure, 1 atmosphere.
