Synthesis and anticancer activity of some fused pyrimidines and related heterocycles

S.A. Al-Issa

Chemistry Department, Faculty of Science, Princess Nora Bint, AbdulRahman University, Riyadh, Saudi Arabia

Received 16 June 2012; accepted 14 September 2012 Available online 24 October 2012

Abstract On account of the reported anticancer of pyrimidine and condensed pyrimidine, a new pyrimido [3,2-b]-1,2,4,5-tetrazine 3a, b, 5c, d, 6, 9, pyrimido [3,2-b]-1,2,4-triazine 10, 11, pyrimido [3,2-b]-1,2,4-triazole 12 and pyrimidine derivatives 1,2a, b, 4c, d, 8, 13, 14, 15 and 16 were synthesized through different chemical reactions. Structures of all synthesized compounds were supported by spectral and elemental analyses. The obtained compounds were evaluated for their in vitro antitumor activity against human liver cancer cell line (HEPG2).

1. Introduction

Pyrimidine and condensed pyrimidine are important classes of heterocyclic compounds that exhibit a broad spectrum of biological activities such as anticancer (Araguchi et al., 2004; Breault et al., 2000; Kim et al., 2003; Deng et al., 2008; Abou El Ella et al., 2008; Nguyen, 2008), antiviral (Depecker et al., 2004; Renau et al., 1996), antibacterial (Kuyper et al., 1996; Gregory et al., 2007), antioxidant (Andrus et al., 1997; Bundy et al., 1995), anxiolytic (Meada et al., 1998) and antidepressant activities (Hogenkamp et al., 2001).

Among its fused bicyclics, the pyrimido [1,2-b]-1,2,4,5-tetrazin-6-ones have inhibitory activity against the human cytomegalovirus (HCMV) protease (Martin et al., 2003).

Pyrimido[5,4-e]-1,2,4-triazine-5,7(2H,6H)-dione derivatives confer significant cytoprotective effects from rotenone toxicity in a cellular rotenone stress assay and Parkinson’s disease (Zhou et al., 2009). Also, pyrimido[5,4-3]-1,2,4-triazine-5,7-diamine based—hypoglycemic agents with protein tyrosine phosphatases inhibitory activity (Kevin et al., 2003).

Fused azoloazine systems have attracted attention due primarily to the fact that they are widespread among natural biologically active compounds (Sidorenko et al., 2010). Among the nitrogen containing heterocycles triazolopyrimidines represent a pharmaceutically important class of compounds because of their diverse range of biological activities such as antitumor (Navarro et al., 1998), cytotoxicity (Magan et al., 2004), therapeutic potentiality (Magan et al., 2005). Potent and selective ATP site directed inhibition of the EGF receptor protein tyrosine kinase (Traxler et al., 1996) and cardiovascular (Rusinov et al., 1986) activities. In addition, they have been found in DNA-interactive drugs (Lauria et al., 2002). Pyrimidine derivatives are attractive due to their pharmacological activity (Foroughifar et al., 2002; Tsuji and Ishikawa, 1994) and possess antiviral (Varma, 1999) antitumor (Kappe et al., 1997), antibacterial (Xie et al., 1999; Kappe, ...
1993), antihypertensive (Atwal et al., 1991), and antituberculous properties (Patel et al., 2006) and effective against wild type and various mutant strains of HIV-1 (Ludovici and Janseen, 2004). In light of the aforementioned facts, I envisioned our approach toward the synthesis of novel pyrimido[2,3-b]-1,2,4,5-tetrazine, pyrimido[2,3-b]-1,2,4-triazine, pyrimido[2,3-b]-1,2,4-triazole and pyrimidine derivatives to evaluate their potential anticancer activities.

2. Results and discussion

The starting material 1-amino-4-methyl-6-phenyl pyrimidin-2-thione was prepared in good yields by the reaction of benzoylaceton and thiosemicarbazide in refluxing ethanol containing catalytic amounts of piperidine afforded a pale yellow product 1 (Scheme 1). The structure of compound 1 was established on the basis of its elemental analyses and spectral data. Thus
structure of 1 is supported by its mass spectrum which showed a molecular ion corresponding to the formula C_{11}H_{11}N_{3}S (M^+ 217). Its IR spectrum revealed absorption bands due to NH2, C==N and C==S groups near 3361, 1644 and 1216 cm\(^{-1}\), respectively. The \(^1\)H NMR spectrum revealed (CH3) protons as a singlet signal around \(\delta\) 2.35 ppm, singlet at \(\delta\) 5.70 ppm assigned to the NH2 protons, singlet at \(\delta\) 8.65 ppm assigned to the H-5 pyrimidine ring and multiplet at \(\delta\) 7.30–8.20 ppm assigned to the aromatic protons. Thenoyl isothiocyanate (Coppo and Fawzi, 1997) or phenyl isothiocyanate reacted with compound 1 to give N-thenoyl or (N-phenyl)-N'-(4-methyl-6-phenyl-2-thioxo pyrimidinyl) thiourea 2a,b. The IR spectrum of compound 2a showed the absence of an absorption band corresponding to the amino group and the appearance of new bands corresponding to (2NH) at 3242, 3135 cm\(^{-1}\) and \(^1\)H NMR showed signals at 12.79 and 10.00 ppm for (2NH).

Treatment of 2a or b with hydrazine hydrate afforded 9-methyl-7-phenyl-4-(2-thenoyl amino (or) phenyl amino)-(3H) pyrimido[3,2-b]-1,2,4,5-tetrazine 3a,b. This reaction proceeds through the initial formation of the intermediate 2', followed by intermolecular cyclization and loss of hydrogen sulfide (lead acetate paper). The structure of compounds 3a,b was confirmed by elemental analysis and their spectral data. The IR spectra of compound 3a showed strong absorption bands in the region 3305, 3259 cm\(^{-1}\) to NH tetrazine ring and NH of secondary amine.

The absorption bands of the aroyl carbonyl for compound 3a were found at, 1665 cm\(^{-1}\) region. In the \(^1\)H NMR spectrum, the signal of NH proton of tetrazine ring recorded at 9.88 ppm (Hany and Hazem, 2008). The \(^13\)C NMR spectrum showed the expected resonance signal of C-5 of tetrazine ring around 111.00 ppm. This assignment is in good agreement with literature data for carbon flanked by two nitrogens and azomethine carbon in six-membered heterocycles (El-Abadelah et al., 1988). The mass spectrum of 3a showed a molecular ion peak m/z at 350 (M^+, 2.72%).

Treatment of compound 1 with acetyl chloride or thenoyl chloride in pyridine resulted in the formation of the 1-(carboxamide (or) 2-thenoylamino)-4-methyl-6-phenyl-pyrimidine-2-thione 4c–d. The IR spectrum of compound 4c showed a strong band in the region of 1695 cm\(^{-1}\) characteristic of C==O of secondary amide. The two bands in the region of 3190, 3320 cm\(^{-1}\) are the stretching modes of HNCO and N==C–OH groups. The \(^1\)H NMR of 4c showed a singlet at \(\delta\) 9.98, 10.76 ppm (1H, HNCOCH3( and a singlet at \(\delta\) 11.33 ppm (1H, HNCOCH3(c. Compounds 5c or d were prepared, under fusion condition of compounds 4c or d with hydrazine hydrate to

Scheme 2
furnish the 4,9-dimethyl-7-phenyl-(3H) pyrimido[3,2-b]-1,2,4,5-tetrazine \(5c\) and 9-methyl-7-phenyl-4-(2-thienyl)(3H) pyrimido[3,2-b]-1,2,4,5-tetrazine \(5d\). This reaction proceeded through the initial formation of the intermediate \(4'\) via loss of water, followed by intramolecular cyclization and loss of hydrogen sulfide (lead acetate paper). Structure of compound \(5c\) was supported on the basis of the elemental analysis (sulfur free, IR, \(^1H\) NMR and mass spectral data). The IR spectrum exhibited the absence of (C\(\text{=O}\)) band and the presence of NH band at 3329 cm\(^{-1}\). \(^1H\) NMR showed signal at \(\delta\) 12.38 ppm for NH tetrazine ring. Mass spectrum of \(5c\) revealed a molecular ion peak \(m/z\) at 239 (M\(^+\), 8.03\%) with a base peak \(m/z\) at 77 (100\%).

6,12-Dimethyl-4,10-diphenyl pyrimido[3,2-b]-1,2,4,5-tetrazino[3,2-b] pyrimidine \(6\) was prepared, via refluxing of...
On repeating the same reaction in xylene the mono thion derivative 1 was obtained based on the IR data which showed the presence of (NH₂) and (C=S) bands. ¹H NMR revealed signal at δ 5.20 ppm for NH₂, ¹³C NMR signal at values of 205 ppm for (C=S) functionality.

In addition, phenyl acetonitrile reacted with 5-chlorosalicylaldehyde in ethanol piperidine (Abd El-Hamid, 1994) to give the corresponding coumarin derivative 7. The structure of compound 7 was established by IR, ¹H NMR, and mass spectrometry. The interaction of compound 7 with compound 1 in boiling ethanol afforded the corresponding N-quinolinone derivative 8 (Scheme 1). Cyclization of 8 under fusion condition with hydrazine hydrate afforded the 4,12-diphenyl-14-methylpyrimido[3,2-b]-1,2,4,5-tetrazino[4,3-a] quinoline 9.

The structures of 8 and 9 were established on the basis of their elemental analysis and spectral data. Their IR and ¹H NMR spectra proved disappearance of amino group (see experimental section) in addition to the mass spectrum of compound 9 which revealed molecular ion peaks m/z at 435.5 (M⁺, 1.12), 437.5 (M⁺, 3.22) (See scheme 2). Interaction of 1 with chloroacetamide in dry DMF led to cyclo-condensation with elimination of HCl and H₂S afforded pyrimido[3,2-b]-1,2,4-triazin-3-one derivative 10. The IR spectrum showed absorption bands at 3375 cm⁻¹ and 1717 cm⁻¹ corresponding to NH and C=O groups (Aly et al., 1995) respectively, its ¹H NMR spectrum showed signals at δ 4.00 and 9.20 ppm assigned to (CH₂CO) and (NH) groups. Both elemental analysis (sulfur free) and spectral data of 10 were consistent with the assigned structure also, interaction of 1 with dithiooxamide, under fusion conditions (Abd El-hamid, 1994). Structure of compound 11 was supported on the basis of elemental analysis, IR, ¹H NMR and mass spectral data. Its IR spectrum showed absorption bands at 3383–3319 cm⁻¹ for the NH₂ group. The ¹H NMR showed amino protons at δ 4.78 ppm, in addition to the mass spectrum which revealed a molecular ion peak m/z at 269 (M⁺, 6.84%), 77 (M⁺, 100%).

When treating compound 1 with excess of potassium t-butoxide and one equivalent of p-cyano acetophenone in t-butanol under reflux for 48 h. (Molina et al., 1985), the 1-amino heterocycle 1 is directly converted into the corresponding 3-(4-acetophenone)-8-methyl-6-phenyl-pyrimido[3,2-b]-1,2,4-triazole 12 in moderate yield (50%). The reaction appears to be quite general for aromatic nitriles; however attempts to apply the method to aliphatic nitriles were unsuccessful. Structural elucidation of 12 is accomplished on the basis of spectral and elemental analysis (sulfur free) data. The ¹H NMR spectrum showed two singlet signals at δ 2.42 and 3.50 ppm assigned to CH₃ and CH₂CO protons, also, its mass spectrum showed an intense peak at m/z = 328 (M⁺, 3.11%) corresponding to the molecular ion. Complete information about the ¹H NMR, IR, ¹³C NMR and mass spectra is presented in the experimental section.

The synthetic approach demonstrated here was extended to enable the synthesis of other functionally substituted pyrimidine for their biological evaluation. Thus, when compound 1 was reacted with ethylamine in refluxing ethanol, the 1-aminoo-2-ethylamino-4-methyl-6-phenyl pyrimidine 13 was obtained. The structure of 13 was established on the basis of their elemental analysis and spectral data. Refluxing of compound 13 in acetic anhydride afforded 1-carboxyamide-2-ethylamino-4-methyl-6-phenyl pyrimidine 14 (Scheme 3). Its IR spectrum showed disappearance of NH₂ and appearance of a

new band at 1668 cm$^{-1}$ for (C=O) group. Moreover, its $^1$H NMR spectrum revealed two characteristic singlet signals at 2.50 and 11.19 ppm due to methyl protons at C-4 of pyrimidine moiety and NH proton, respectively. 1-(1$H$-pyrrol-1-yl)-4-methyl-6-phenyl-pyrimidine-2-thione 15 was prepared, when compound 1 was condensed with 2,5-dimethoxy tetrahydrofuran in glacial acetic acid. The structure of compound 15 was confirmed on the basis of elemental analysis and spectral data.

The IR spectrum of 15 revealed the disappearance of the NH$_2$ bands. Additionally, mass spectrum of 15 revealed molecular ion peak 267 (1.02%).

Compound 1 reacted with ethyl acetoacetate to afford ethyl-3-(4-methyl-6-phenylpyrimidine-2-thione-1-yl amino)but-2-enoate 16. The $^1$H NMR of 16, olefinic proton in the side-chain resonated as a singlet at $\delta$ 4.75 ppm and NH signal was located in the region $\delta$ 10.97 ppm.
3. Conclusion

In the present work, the synthesis of pyrimido[3,2-\(b\)]-1,2,4,5-tetrazine 3a,\(b\),5a,6,9, pyrimido[3,2-\(b\)]-1,2,4-triazine 10,11, pyrimido[3,2-\(b\)]-1,2,4-triazole 12 and pyrimidine derivatives 1,2a,b,4a,c,8,13,14,15,16 is reported. All spectroscopic analyses confirmed the proposed structures of these compounds. Anti-
tumor activity data have shown that the synthesized compounds have a significant antitumor activity against (HEPG2) cancer cell line.

4. Experimental

Melting points are uncorrected and were determined on a Stuart melting point apparatus. Elemental analyses (C,H,N) were performed on Perkin–Elmer 2400 analyzer. The IR spectra (KBr) were measured on (Pye unicam SP 1000 IR spectrophotometer). \(^1\)H NMR spectra were obtained on a Bruker proton NMR–Avance 300 (300 MHz) using tetramethyl silane (TMS) as internal standard. Mass spectra were run on Varian MAT 311-A 70ev. The synthesized compounds were screened in vitro antitumor activity at the regional center for mycology and biotechnology, Al-AZHAR UNIVERSITY.

4.1. 1-Amino-4-methyl-6-phenyl pyrimidin-2-thione

A mixture of benzoyl acetone (0.01 mol) and thiosemicarbazide (0.01 mol) in ethanol (50 ml) containing 3 drops of piperidine was refluxed for 5 h. The reaction mixture was concentrated and allowed to cool and the solid obtained was recrystallized from ethanol. Yield 79%; m.p. 160–162 °C; IR (KBr, cm\(^{-1}\)) 3361, 3308 (NH\(_2\)), 3050 (CH arom.), 2922 (CH aliph.), 1644 (C\(^{\equiv}\)N), 1216 (C\(^{\equiv}\)S). \(^1\)H NMR (DMSO-\(d_6\)) \(\delta\) 2.35 (s, 3H, CH\(_3\)), 5.70 (s, 2H, NH\(_2\)), 7.30–8.20 (m, 5H, Ar-H), 8.65 (s, 1H, (H-5) pyrimidine); \(^1\)C NMR: \(\delta\) 16.10 (CH\(_3\)), 111.18–145.10 (Caromatic), 205.00 (C\(^{\equiv}\)S); MS, \(m/z\) (%): 217 [M\(^+\), 3.37], 77 [100]. - 3324, 3135 (NH), 3005 (CH arom.), 2999 (CH aliph.), 1695 (C=N), 1597 (C=O and N=O), 1375, 1228 (C=O). Found: C, 60.30; H, 5.00, N, 22.80.

4.7. 6-Chloro-3-phenyl coumarine 7

A mixture of the appropriate phenylacetonitrile (0.005 mol) and 5-chloro-salicylaldehyde (0.005 mol) in ethanol (35 ml) containing piperidine (5 drops) was refluxed for 4 h. The reaction mixture was cooled and then acidified with dilute hydrochloric acid. The solid so formed was collected and recrystallized from ethanol, yield 80%; m.p. 200–202 °C; IR (KBr, cm\(^{-1}\)):

- 3324, 3135 (NH), 3005 (CH arom.), 2999 (CH aliph.), 1695 (C=N), 1644 (C=N), 1228 (C=S); IR (KBr, cm\(^{-1}\)):
4.8. 6-Methyl-4-phenyl-3-[3-phenylquinoxoline-2-one pyrimidin-2-thione 8

A mixture of 1 (0.01 mol) and 3-phenyl-6-chloro coumarin 7 (0.012 mol) was refluxed in ethanol (50 ml) for 12 h. The solid product was recrystallized from dioxane; yield 65%; m.p. 120–122°C; IR (KBr, cm⁻¹) 3055 (CH arom.), 2900–2880 (CH aliph.), 1680 (C=O), 1648 (C=C), 1600 (C=C). ¹H NMR (DMSO-d₆) δ 2.33 (s, 3H, CH₃), 7.29–8.41 (m, 15H, Ar-H). Anal. Calcd. For: C₃₂H₁₈ClON₃S: C, 68.49; H, 4.08; N, 26.02; S, 11.89. Found: C, 68.50; H, 4.00; N, 26.38.

4.9. 4,12-Diphenyl-14-methyl pyrimido[3,2-b]-1,2,4,5-tetrazine[4,3-a] quinoline 9

A mixture of compound 8 (0.01 mol) and hydrazine hydrate (0.005 mol) and chloroacetamide (0.09 mol) in acetic anhydride (20 ml) was heated for 10 min. The reaction mixture was poured into ice-water (40 ml) to give a solid precipitate which was filtered off and recrystallized from petroleum ether 60/80 to give 14; yield 65%; m.p. 300–302°C. IR (KBr cm⁻¹) 3183 (NH), 3055 (CH arom.), 2998 (CH aliph.), 1717 (C=O), 1640 (C=C), 1617 (C=N), 1484 (C aromatic), 1472, 1468, 1448, 1420, 1400, 1340, 1320, 1260, 1240, 1170, 1150, 1130, 1100, 1030, 1010, 980, 940, 920, 870, 850, 800, 770, 760, 740, 720, 700, 680, 660, 640, 620, 600, 580, 560, 540, 520, 500, 480, 460, 440, 420, 400, 380, 360, 340, 320, 300, 280, 260, 240, 220, 200, 180, 160, 140, 120, 100, 80, 60, 40, 20, 10, 8, 6, 4, 2, 1. ¹H NMR (DMSO-d₆) δ 2.49 (s, 3H, CH₃), 2.64 (s, 3H, CH₃CO), 114.11–139.01 (C aromatic), 180.60 (C=O). MS (m/z): 240 [M⁺] (6.09), 77 (100).

4.10. 9-Methyl-7-phenyl-(5H) pyrimidino[3,2-b]-1,2,4-triazin-3-thione 10

A mixture of compound 1 (0.005 mol) and dithiooxamide (0.005 mol) in dry DMF (30 ml) was refluxed for 48 h. The reaction mixture was cooled, the solid was filtered off and recrystallized from DMF. Yield 53%; m.p. 320–322°C. IR (KBr cm⁻¹) 3375 (NH), 3055 (CH arom.), 2988 (CH aliph.), 1717 (C=O), 1640 (C=C), 1617 (C=N), 1484 (C aromatic), 1472, 1468, 1448, 1420, 1400, 1340, 1320, 1260, 1240, 1170, 1150, 1130, 1100, 1030, 1010, 980, 940, 920, 870, 850, 800, 770, 760, 740, 720, 700, 680, 660, 640, 620, 600, 580, 560, 540, 520, 500, 480, 460, 440, 420, 400, 380, 360, 340, 320, 300, 280, 260, 240, 220, 200, 180, 160, 140, 120, 100, 80, 60, 40, 20, 10, 8, 6, 4, 2, 1. ¹H NMR (DMSO-d₆) δ 2.49 (s, 3H, CH₃), 2.64 (s, 3H, CH₃CO), 114.11–139.01 (C aromatic), 180.60 (C=O). MS (m/z): 240 [M⁺] (6.09), 77 (100).

4.11. 4-Amino-9-methyl-7-phenyl pyrimidino[3,2-b]-1,2,4-triazin-3-thione 11

A solution of compound 13 (0.005 mol) in acetic anhydride (20 ml) was heated for 10 min. The solvent was evaporated under reduced pressure, then the reaction mixture was poured into ice-water (40 ml) to give a solid precipitate which was filtered off and recrystallized from petroleum ether 60/80 to give 14; yield 65%; m.p. 300–302°C. IR (KBr cm⁻¹) 3183 (NH), 3055 (CH arom.), 2990–2882 (CH aliph.), 1637 (C=O), 1658 (C=O). ¹H NMR (DMSO-d₆) δ 2.50 (s, 3H, CH₃), 2.64 (s, 3H, CH₃CO), 1.14 (t, 3H, CH₂CH₃), J = 7.28 Hz), 4.25 (q, 2H, CH₂CH₃), J = 7.28 Hz). 1H Pyrrol-1-yl)4-methyl-6-phenyl-pyrimidin-2-thione 15

A solution of compound 1 (0.09 mol), p-cyanobenzophenone (10 mmol), and Potassium tert-butoxide (20 mmol) in t-butanol (50 ml) was refluxed for 48 h. After cooling, the solvent was evaporated under reduced pressure, the crude product was washed with cold water (50 ml), separated by filtrations and recrystallized from ethanol to give 12, yield 50%; m.p. 260–262°C. IR (KBr cm⁻¹) 3055 (CH arom.), 2999–3880 (CH aliph.), 1648 (C=C), 1600 (C=C). ¹H NMR (DMSO-d₆) δ 2.42, 3.50 (2s, 6H, (CH₃) and (CH₂CO), 1.13 (t, 3H, CH₃), J = 7.28 Hz), 4.25 (q, 2H, CH₂CH₃), J = 7.28 Hz). 1H Pyrrol-1-yl)4-methyl-6-phenyl-pyrimidin-2-thione 15
Ar-H and CH-pyrrol) 8.32 (s, 1H, CH-pyrimidine); MS: m/z (%): 267 [M+] (1.02), 77 (100). Anal. Calcd. For: C_{15}H_{13}N_{3}S: C, 67.41; H, 4.86; N, 15.73; S, 11.98. Found: C, 62.18; H, 5.50; N, 12.70; S, 9.72. Anal. Calcd. For: C_{17}H_{19}N_{3}O_{2}S: C, 62.00; H, 5.50; N, 12.76; S, 9.72. Found: C, 62.18; H, 5.50; N, 12.70; S, 10.00.

5. Biological testing

5.1. Materials

Doxorubicin, the reference drug used in this study, is one of the most effective anticancer agents.

HEPG2 cells (human cell line of a well differentiated hepatocellular carcinoma isolated from a liver biopsy of male Caucasian aged 15 years) were obtained from the American type culture collection (ATCC). All other chemicals were obtained from sigma chemical company (st. Louis, Mo., USA).

5.2. Evaluation of cellular cytotoxicity

The cytotoxic activity of the target compounds against HEPG2 cells was determined using cytotoxicity assay. In brief, the cells were seeded in a 96-well plate with a cell concentration of 1 x 10^4 cell per well in 100 μl of growth medium and fresh medium containing different concentrations of the test sample was added after 24 h of seeding. Serial twofold dilution of the tested chemical compound was added to confluent cell monolayers dispensed into 96-well, flat-bottomed microtiter plates (Falcon, NJ, USA) using a multichannel pipette. The microtiter plates were incubated at 37 °C in a humidified incubator with 5% CO2 for a period of 48 h. Three wells were used for each concentration of the test sample. Control cells were incubated without test sample and with or without DMSO. The low percentage of DMSO present in the wells (maximal 0.1%) was found not to affect the experiment. After incubation of the cells for 24 h at 37 °C, various concentrations of sample (50, 25, 12.5, 6.25, 3.125 & 1.56 μg) were added, and the incubation was continued for 48 h and viable cell yield was determined by a colorimetric method. In brief, after the end of the incubation period, media were aspirated and the crystal violet solution (1%) was added to each well for at least 30 min. The stain was removed and the plates were rinsed using tap water until all excess stain was removed. Glacial acetic acid (30%) was then added to all wells and mixed thoroughly, and then the absorbances of the plates were measured after gently shaking on microplate reader, using a test wavelength of 490 nm. All results were corrected for background absorbance detected in wells without added stain. Treated samples were compared with the cell control in the absence of the tested compounds. All experiments were carried out in triplicate. The cell cytotoxic effect of each tested compound was calculated (Mosmann, 1983; Vijayan et al., 2004) (Figs. 1–20).

5.3. Evaluation of cytotoxicity activity against the human liver cancer (HEPG2) cell line

The antitumor activities of compounds were assessed against HEPG2 cancer cell line in comparison to the traditional anticancer drug (Doxorubicin) on the basis of monitoring the inhibition of the growth of human cancer cells, a series of synthesized compounds possessing a broader spectrum of anticancer activity. Ninety tested compounds (1; 2a,b; 3a,b; 4a,d; 5a,d; 6,8,9,10,11,12,13,14,15 and 16) were subjected to a screening system for investigation of their antitumor potency against liver (HEPG2) cell line. The anticancer activity results indicated that most of the compounds showed inhibition activity against the tested cell line but varying intensity extents in comparison to the known anticancer drug (Doxorubicin) (See Table 1).

Compounds 2a,b showed significant in vitro antitumor activity (IC_{50}, 17.4 μg/ml, 23.6 μg/ml) and possess thiourea moiety which is known to have antitumor activity (Abou El Ella et al., 2008; Agrawal et al., 2002). Also, fusion of pyrimido[3,2-h]-1,2,4,5-tetrazine in tri(or) tetracyclic structure namely pyrimido tetrazinopyrimidine (6) (IC_{50}, 45.9 μg/ml) or pyrimidotetrazino quinoline (9) (IC_{50}, 39.8 μg/ml) enhances the antitumor activity.
