Abstract

Our purpose is to introduce a two-parametric (p,q)-analogue of the Stancu-Beta operators. We study approximating properties of these operators using the Korovkin approximation theorem and also study a direct theorem. We also obtain the Voronovskaya-type estimate for these operators. Furthermore, we study the weighted approximation results and pointwise estimates for these operators.

Keywords: Stancu-Beta operators; linear positive operators; Lipschitz function; modulus of continuity; rate of convergence; Voronovskaya-type theorem

1 Introduction

The q-calculus has attracted attention of many researchers because of its applications in various fields such as numerical analysis, computer-aided geometric design, differential equations, and so on. In the field of approximation theory, the application of q-calculus has been the area of many recent researches.

Lupaş [1] presented the first q-analogue of the classical Bernstein operators in 1987. He studied the approximation and shape-preserving properties of these operators. Another q-companion of the classical Bernstein polynomials is due to Phillips [2]. Inspired by this, several authors produced generalizations of well-known positive linear operators based on q-integers and studied them extensively. For instance, the approximation properties of the Kantorovich-type q-Bernstein operators [3], q-BBH operators [4], q-analogue of generalized Bernstein-Schurer operators [5], weighted statistical approximation by Kantorovich-type q-Szász-Mirakjan operators [6], q-Szász-Durrmeyer operators [7], operators constructed by means of q-Lagrange polynomials and A-statistical approximation [8], statistical approximation properties of modified q-Stancu-Beta operators [9], and q-Bernstein-Schurer-Kantorovich operators [10].

The q-calculus has led to the discovery of the (p,q)-calculus. Recently, Mursaleen et al. have used the (p,q)-calculus in approximation theory. They have applied it to construct a (p,q)-analogue of the classical Bernstein operators [11], a (p,q)-analogue of the Bernstein-Stancu operators [12], and a (p,q)-analogue of the Bernstein-Schurer operators [13] and have studied their approximation properties. Most recently, (p,q)-analogues of some other operators have been studied in [14–18], and [19].

We now give some basic notions of the (p,q)-calculus.

The (p,q)-integer is defined by

$$[n]_{p,q} = \frac{p^n - q^n}{p - q}, \quad n = 0,1,2,\ldots,0 < q < p \le 1.$$

The (p,q)-companion of the binomial expansion is

$$(ax + by)^n_{p,q} = \sum_{k=0}^{n} \binom{n}{k}_{p,q} q^{\frac{k(k-1)}{2}} p^{\frac{(n-k)(n-k-1)}{2}} a^{n-k} b^k x^{n-k} y^k,$$

$$(x + y)^n_{p,q} = (x + y)(px + qy)\bigl(p^2x + q^2y\bigr) \cdots \bigl(p^{n-1}x + q^{n-1}y\bigr).$$

The (p,q)-analogues of the binomial coefficients are defined by

$$\binom{n}{k}_{p,q} = \frac{[n]_{p,q}!}{[k]_{p,q}![n-k]_{p,q}!}.$$

The (p,q)-analogues of definite integrals of a function f are defined by

$$\int_0^a f(x)\,d_{p,q}x = (q - p)a \sum_{k=0}^{\infty} \frac{p^k}{q^{k+1}} f\left(\frac{p^k}{q^{k+1}}a\right) \quad \text{when } \left|\frac{p}{q}\right| < 1$$

and

$$\int_0^a f(x)\,d_{p,q}x = (p - q)a \sum_{k=0}^{\infty} \frac{q^k}{p^{k+1}} f\left(\frac{q^k}{p^{k+1}}a\right) \quad \text{when } \left|\frac{q}{p}\right| < 1.$$

For $m, n \in N$, the (p,q)-gamma and the (p,q)-beta functions are defined by

$$\Gamma_{p,q}(n) = \int_0^{\infty} p^{\frac{n(n-1)}{2}} E_{p,q}(-qx)\,d_{p,q}x, \qquad \Gamma_{p,q}(n + 1) = [n]_{p,q}!$$

and

$$B_{p,q}(m,n) = \int_0^{\infty} \frac{x^{m-1}}{(1 + x)^{m+n}}\,d_{p,q}x, \tag{1.1}$$

respectively. These two are related by

$$B_{p,q}(m,n) = q^{\frac{2-m(m-1)}{2}} p^{\frac{-m(m-1)}{2}} \frac{\Gamma_{p,q}(n)\Gamma_{p,q}(m)}{\Gamma_{p,q}(m + n)}. \tag{1.2}$$

For $p = 1$, all the concepts of the (p,q)-calculus reduce to those of q-calculus. The details on (p,q)-calculus can be found in [20–22].

Stancu [23] introduced the beta operators to approximate the Lebesgue-integrable functions on $[0,\infty)$ as follows:

$$L_n(f,x) = \frac{1}{B(nx, n + 1)} \int_0^{\infty} \frac{t^{nx}}{(1 + t)^{nx+n+1}} f(t)\,dt.$$

The q-companion of the Stancu-Beta operators was given by Aral and Gupta [24] as follows:

$$L_n(f,x) = \frac{K(A,[n]_q x)}{B([n]_q x,[n]_q+1)} \int_0^{\infty/A} \frac{u^{[n]_q x-1}}{(1+u)^{[n]_q x+[n]_q+1}} f\left(q^{[n]_q x}u\right)\,d_q u.$$

Let $0 < q < p < 1$. Mursaleen et al. [25] constructed the (p,q)-Stancu-Beta operators as follows:

$$L_n^{p,q}(f,x) = \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^{\infty} \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} f\left(p^{[n]_{p,q}x}q^{[n]_{p,q}x}u\right)\,d_{p,q}u. \quad (1.3)$$

They investigated the approximating properties and estimated the rate of convergence of these operators. Motivated by this work, we introduce the following sequence of operators:

$$\begin{aligned} S_{n,p,q}^{\alpha,\beta}(f;x) &= \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \\ &\quad \times \int_0^{\infty} \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} f\left(\frac{[n]_{p,q}p^{[n]_{p,q}x}q^{[n]_{p,q}x}u+\alpha}{[n]_{p,q}+\beta}\right)\,d_{p,q}u, \end{aligned} \quad (1.4)$$

where $0 \le \alpha \le \beta$. We call them two-parametric (p,q)-Stancu-Beta operators. For $\alpha = 0 = \beta$, the operators (1.4) coincide with the operators (1.3). So the latter is a generalization of the former.

2 Main results

We shall investigate approximation results for the operators (1.4). We calculate the moments of the operators $S_{n,p,q}^{\alpha,\beta}(f;x)$ in the following lemma.

Lemma 2.1 *Let $S_{n,p,q}^{\alpha,\beta}(f;x)$ be given by* (1.4). *Then we have the following equalities*:

(i) $S_{n,p,q}^{\alpha,\beta}(1;x) = 1$,

(ii) $S_{n,p,q}^{\alpha,\beta}(t;x) = \frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x + \frac{\alpha}{([n]_{p,q}+\beta)}$,

(iii) $S_{n,p,q}^{\alpha,\beta}(t^2;x) = \frac{[n]_{p,q}^3}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}x^2 + \frac{[n]_{p,q}}{([n]_{p,q}+\beta)^2}(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)} + 2\alpha)x + \frac{\alpha^2}{([n]_{p,q}+\beta)^2}$.

Proof Using (1.1), (i) is immediate. Further,

$$\begin{aligned} S_{n,p,q}^{\alpha,\beta}(t;x) &= \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \\ &\quad \times \int_0^{\infty} \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} \left(\frac{[n]_{p,q}p^{[n]_{p,q}x}q^{[n]_{p,q}x}u+\alpha}{([n]_{p,q}+\beta)}\right) d_{p,q}u \\ &= \frac{[n]_{p,q}}{([n]_{p,q}+\beta)} \frac{p^{[n]_{p,q}x}q^{[n]_{p,q}x}}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^{\infty} \frac{u^{[n]_{p,q}x}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}}\,d_{p,q}u \\ &\quad + \frac{\alpha}{([n]_{p,q}+\beta)} \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^{\infty} \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}}\,d_{p,q}u \\ &= \frac{[n]_{p,q}}{([n]_{p,q}+\beta)} L_n^{p,q}(t;x) + \frac{\alpha}{([n]_{p,q}+\beta)} L_n^{p,q}(1;x) \\ &= \frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x + \frac{\alpha}{([n]_{p,q}+\beta)}, \end{aligned}$$

and (ii) is proved;

$$\begin{aligned}
S_{n,p,q}^{\alpha,\beta}\left(t^2;x\right) &= \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \\
&\quad \times \int_0^\infty \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} \left(\frac{[n]_{p,q}p^{[n]_{p,q}x}q^{[n]_{p,q}x}u+\alpha}{([n]_{p,q}+\beta)}\right)^2 d_{p,q}u \\
&= \frac{[n]_{p,q}^2}{([n]_{p,q}+\beta)^2} \frac{p^{2[n]_{p,q}x}q^{2[n]_{p,q}x}}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^\infty \frac{u^{[n]_{p,q}x+1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} d_{p,q}u \\
&\quad + \frac{2\alpha}{[n]_{p,q}}\left([n]_{p,q}+\beta\right)^2 \frac{q^{[n]_{p,q}x}}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^\infty \frac{u^{[n]_{p,q}x}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} d_{p,q}u \\
&\quad + \frac{\alpha^2}{([n]_{p,q}+\beta)^2} \frac{1}{B_{p,q}([n]_{p,q}x,[n]_{p,q}+1)} \int_0^\infty \frac{u^{[n]_{p,q}x-1}}{(1+u)^{[n]_{p,q}x+[n]_{p,q}+1}} d_{p,q}u \\
&= \frac{[n]_{p,q}^2}{([n]_{p,q}+\beta)^2} L_n^{p,q}\left(t^2;x\right) + \frac{2\alpha[n]_{p,q}}{([n]_{p,q}+\beta)^2} L_n^{p,q}(t;x) + \frac{\alpha^2}{([n]_{p,q}+\beta)^2} L_n^{p,q}(1;x) \\
&= \frac{[n]_{p,q}^2}{([n]_{p,q}+\beta)^2}\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)}x^2 + \frac{1}{pq([n]_{p,q}-1)}x\right) \\
&\quad + \frac{2\alpha[n]_{p,q}}{([n]_{p,q}+\beta)^2} + \frac{\alpha^2}{([n]_{p,q}+\beta)^2} \\
&= \frac{[n]_{p,q}^3}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}x^2 + \frac{n}{([n]_{p,q}+\beta)^2}\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)} + 2\alpha\right)x \\
&\quad + \frac{\alpha^2}{([n]_{p,q}+\beta)^2},
\end{aligned}$$

which proves (iii).

Hence, the lemma is proved. □

We readily obtain the following lemma.

Lemma 2.2 *Let $p,q \in (0,1)$. Then, for $x \in [0,\infty)$, we have:*
(i) $S_{n,p,q}^{\alpha,\beta}((t-x);x) = \frac{\alpha-\beta x}{([n]_{p,q}+\beta)}$,
(ii) $S_{n,p,q}^{\alpha,\beta}((t-x)^2;x) \le (\frac{[n]_{p,q}}{pq([n]_{p,q}-1)} - \frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)})x^2 + \frac{1}{pq([n]_{p,q}-1)}x + \frac{\alpha^2}{([n]_{p,q}+\beta)^2} \le \frac{2(1+\beta)^2x^2+x+\alpha^2}{pq([n]_{p,q}-1)}$.

Proof We have

$$\begin{aligned}
S_{n,p,q}^{\alpha,\beta}\left((t-x);x\right) &= S_{n,p,q}^{\alpha,\beta}(t;x) - xS_{n,p,q}^{\alpha,\beta}(1;x) \\
&= \frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x + \frac{\alpha}{([n]_{p,q}+\beta)} - x \\
&= \left(\frac{[n]_{p,q}}{([n]_{p,q}+\beta)} - 1\right)x + \frac{\alpha}{([n]_{p,q}+\beta)} \\
&= \frac{-\beta}{([n]_{p,q}+\beta)}x + \frac{\alpha}{([n]_{p,q}+\beta)} \\
&= \frac{\alpha-\beta x}{([n]_{p,q}+\beta)},
\end{aligned}$$

which proves (i). Now

$$\begin{aligned}
&S_{n,p,q}^{\alpha,\beta}\big((t-x)^2;x\big)\\
&\quad= S_{n,p,q}^{\alpha,\beta}\big(t^2;x\big)+x^2S_{n,p,q}^{\alpha,\beta}(1;x)-2xS_{n,p,q}^{\alpha,\beta}(t;x)\\
&\quad= \frac{[n]_{p,q}^3}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}x^2+\frac{[n]_{p,q}}{([n]_{p,q}+\beta)^2}\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)}+2\alpha\right)x\\
&\qquad+\frac{\alpha^2}{([n]_{p,q}+\beta)^2}-2x\left(\frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x+\frac{\alpha}{([n]_{p,q}+\beta)}\right)+x^2\\
&\quad= \frac{[n]_{p,q}^3}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}-\frac{2[n]_{p,q}}{([n]_{p,q}+\beta)+1}x^2+\frac{[n]_{p,q}^2}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}\\
&\qquad+\frac{2\alpha[n]_{p,q}}{([n]_{p,q}+\beta)^2}-\frac{2\alpha}{([n]_{p,q}+\beta)}x+\frac{\alpha^2}{([n]_{p,q}+\beta)^2}\\
&\quad\le \left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)}-\frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)}\right)x^2+\frac{1}{pq([n]_{p,q}-1)}x+\frac{\alpha^2}{([n]_{p,q}+\beta)^2}\\
&\quad= \frac{\{(p-q)[n]_{p,q}^3+([n]_{p,q}+pq[n]_{p,q}-pq)\beta^2+(2\beta+pq)[n]_{p,q}^2\}x^2+([n]_{p,q}+\beta)^2)x+pq([n]_{p,q}-1)\alpha^2}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}\\
&\quad= \frac{\{(p^n-q^n)[n]_{p,q}^2+([n]_{p,q}+pq[n]_{p,q}-pq)\beta^2+(2\beta+pq)[n]_{p,q}^2\}x^2+([n]_{p,q}+\beta)^2)x+pq([n]_{p,q}-1)\alpha^2}{pq([n]_{p,q}-1)([n]_{p,q}+\beta)^2}\\
&\quad\le \frac{2(\beta^2+\beta+1)x^2+x+\alpha^2}{pq([n]_{p,q}-1)}\\
&\quad\le \frac{2(\beta+1)^2x^2+x+\alpha^2}{pq([n]_{p,q}-1)}
\end{aligned}$$

which gives (ii). Hence, the lemma is proved. □

Next, we present a direct theorem for the operators $S_{n,p,q}^{\alpha,\beta}(f;x)$.

We denote By $C_B[0,\infty)$, the space of all real-valued continuous bounded functions f on the interval $[0,\infty)$ endowed with the norm

$$\|f\| = \sup_{0\le x<\infty}\big|f(x)\big|.$$

Let $\delta>0$ and $W^2=\{h: h',h''\in C(I), I=[0,\infty)\}$, then the Peetre K-functional is defined by

$$K_2(f,\delta)=\inf_{h\in W^2}\big\{\|f-h\|+\delta\big\|h''\big\|\big\}.$$

The second-order modulus of continuity ω_2 of f is defined as

$$\omega_2(f,\sqrt{\delta})=\sup_{0<p<\delta^{\frac{1}{2}}}\sup_{x\in I}\big|f(x+2p)-2f(x+p)+f(x)\big|.$$

By DeVore-Lorentz theorem (see [26], p.177, Theorem 2.4) there exists a constant $C>0$ such that

$$K_2(f,\delta)\le C\omega_2(f,\sqrt{\delta}). \tag{2.1}$$

Also, by $\omega(f,\delta)$ we denote the first-order modulus of continuity of $f \in C(I)$ defined as

$$\omega(f,\delta) = \sup_{0<p<\delta} \sup_{x\in I} \left| f(x+p) - f(x) \right|.$$

We shall use the notation $\nu^2(x) = x + x^2$.

Theorem 2.3 *Suppose that $f \in C_B[0,\infty)$ and $0 < p,q < 1$. Then for all $x \in [0,\infty)$ and $n \geq 2$, there exists a constant C such that*

$$\left| S_{n,p,q}^{\alpha,\beta}(f;x) - f(x) \right| \leq C\omega_2\left(f, \frac{\delta_n(x)}{\sqrt{pq([n]_{p,q}-1)}}\right) + \omega\left(f, \frac{\gamma_n(x)}{[n]_{p,q}+\beta}\right),$$

where

$$\delta_n^2(x) = \nu^2(x) + \frac{2pq\alpha^2}{([n]_{p,q}+\beta)}$$

and

$$\gamma_{n(x)}^2 = (\alpha - \beta x)^2 + [n]_{p,q}\big([n]_{p,q}+\beta\big)x^2 + \alpha\beta x.$$

Proof Let us define the auxiliary operators

$$S_{n,p,q}^{*\alpha,\beta}(f;x) = S_{n,p,q}^{\alpha,\beta}(f;x) - f\left(\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}\right) + f(x). \tag{2.2}$$

By the Lemma 2.1 it is readily seen that these operators are linear and

$$S_{n,p,q}^{*\alpha,\beta}\big((t-x);x\big) = 0. \tag{2.3}$$

Suppose that $g \in W^2$. By the Taylor expansion we can write

$$g(t) = g(x) + g'(x)(t-x) + \int_x^t (t-u)g''(u)\,du, \quad t \in [0,\infty).$$

Operating by $S_{n,p,q}^{*\alpha,\beta}(.;x)$ on both sides of the above and using (2.3), we obtain:

$$S_{n,p,q}^{*\alpha,\beta}(g;x) = g(x) + S_{n,p,q}^{*\alpha,\beta}\left(\int_x^t (t-u)g''(u)\,du;x\right),$$

$$S_{n,p,q}^{*\alpha,\beta}(g;x) - g(x) = S_{n,p,q}^{*\alpha,\beta}\left(\int_x^t (t-u)g''(u)\,du;x\right),$$

$$\left|S_{n,p,q}^{*\alpha,\beta}(g;x) - g(x)\right| = \left|S_{n,p,q}^{*\alpha,\beta}\left(\int_x^t (t-u)g''(u)\,du;x\right)\right|.$$

Using (2.2) in the right-hand side, we get

$$\left|S_{n,p,q}^{*\alpha,\beta}(g;x) - g(x)\right| = \left|S_{n,p,q}^{\alpha,\beta}\left(\int_x^t (t-u)g''(u)\,du;x\right) - \int_x^{\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}} \left(\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta} - u\right)g''(u)\,du\right|.$$

So we obtain

$$\begin{aligned}&\left|S^{*\alpha,\beta}_{n,p,q}(g;x)-g(x)\right|\\&\leq\left|S^{\alpha,\beta}_{n,p,q}\left(\int_x^t(t-u)g''(u)\,du;x\right)\right|+\left|\int_x^{\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}}\left(\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}-u\right)g''(u)\,du\right|\\&\leq S^{\alpha,\beta}_{n,p,q}\left(\left|\int_x^t(t-u)g''(u)\,du\right|;x\right)+\int_x^{\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}}\left|\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}-u\right|\left|g''(u)\right|\,du.\end{aligned}$$

Using the linearity of the integral operator and the operator $S^{\alpha,\beta}_{n,p,q}(\cdot;x)$ in the second and first parts of right-hand side, respectively, and using the fact that for all $x\in[0,\infty)$,

$$\left|g(x)\right|\leq\|g\|,$$

we obtain

$$\left|S^{*\alpha,\beta}_{n,p,q}(g;x)-g(x)\right|\leq\left\|g''\right\|S^{\alpha,\beta}_{n,p,q}\left((t-x)^2;x\right)+\left\|g''\right\|\int_x^{\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}}\left|\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}-u\right|\,du. \quad (2.4)$$

In the first part, solving the integral $\int_x^t|t-u|\,du$ and using the linearity of the operators $S^{\alpha,\beta}_{n,p,q}(\cdot;x)$, we readily see that

$$S^{\alpha,\beta}_{n,p,q}\left(\int_x^t|t-u|\,du\right)\leq S^{\alpha,\beta}_{n,p,q}\left((t-x)^2;x\right),$$

and after some calculations, for the second part of (2.4), we get

$$\begin{aligned}&\int_x^{\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}}\left|\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}-u\right|\,du\\&\leq\frac{([n]_{p,q}x+\alpha)^2-x([n]_{p,q}x+\alpha)([n]_{p,q}+\beta)+x^2([n]_{p,q}+\beta)^2}{([n]_{p,q}+\beta)^2}\\&=\frac{(\alpha-\beta x)^2+[n]_{p,q}x^2([n]_{p,q}+\beta)+\alpha\beta x}{([n]_{p,q}+\beta)^2}\\&=\left(\frac{\alpha-\beta x}{[n]_{p,q}+\beta}\right)^2+\frac{[n]_{p,q}}{[n]_{p,q}+\beta}x^2+\frac{\alpha\beta}{([n]_{p,q}+\beta)^2}x.\end{aligned}$$

So by (2.4), we obtain

$$\begin{aligned}&\left|S^{*\alpha,\beta}_{n,p,q}(g;x)-g(x)\right|\\&\leq\left\|g''\right\|\left(S^{\alpha,\beta}_{n,p,q}\left((t-x)^2;x\right)+\left(\frac{\alpha-\beta x}{[n]_{p,q}+\beta}\right)^2+\frac{[n]_{p,q}}{[n]_{p,q}+\beta}x^2+\frac{\alpha\beta}{([n]_{p,q}+\beta)^2}x\right). \quad (2.5)\end{aligned}$$

Using Lemma 2.2(ii), we obtain

$$\begin{aligned}&S^{\alpha,\beta}_{n,p,q}\left((t-x)^2;x\right)+\left(\frac{\alpha-\beta x}{[n]_{p,q}+\beta}\right)^2+\frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x^2+\frac{\alpha\beta}{([n]_{p,q}+\beta)^2}x\\&\leq\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)}-\frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)}\right)x^2+\frac{1}{pq([n]_{p,q}-1)}x+\frac{\alpha^2}{([n]_{p,q}+\beta)^2}\end{aligned}$$

$$
\begin{aligned}
&\quad + \left(\frac{\alpha-\beta x}{[n]_{p,q}+\beta}\right)^2 + \frac{[n]_{p,q}}{([n]_{p,q}+\beta)}x^2 + \frac{\alpha\beta}{([n]_{p,q}+\beta)^2}x \\
&\leq \frac{(p-q)[n]_{p,q}^3}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)}x^2 + \frac{[n]_{p,q}^2 + 4pq(1-[n]_{p,q})\alpha\beta}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)}x + \frac{2\alpha^2}{([n]_{p,q}+\beta)^2} \\
&\leq \frac{(p-q)[n]_{p,q}^3x^2 + [n]_{p,q}^2x + 2pq([n]_{p,q}-1)\alpha^2}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)} \\
&= \frac{(p^n-q^n)[n]_{p,q}^2x^2 + [n]_{p,q}^2x + 2pq([n]_{p,q}-1)\alpha^2}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)} \\
&\leq \frac{[n]_{p,q}^2x^2 + [n]_{p,q}^2x + 2pq[n]_{p,q}\alpha^2}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)} \\
&\leq \frac{[n]_{p,q}(1+x)x + 2pq\alpha^2}{pq([n]_{p,q}+\beta)^2([n]_{p,q}-1)} \\
&\leq \frac{1}{pq([n]_{p,q}-1)}\left(\nu^2(x) + \frac{2pq\alpha^2}{([n]_{p,q}+\beta)}\right) \\
&= \frac{\delta_n^2(x)}{pq([n]_{p,q}-1)},
\end{aligned}
$$

where

$$
\delta_n^2(x) = \nu^2(x) + \frac{2pq\alpha^2}{([n]_{p,q}+\beta)}.
$$

Therefore, by (2.5) we get

$$
\left|S_{n,p,q}^{*\alpha,\beta}(g;x) - g(x)\right| \leq \frac{\delta_n^2(x)}{pq([n]_{p,q}-1)}\left\|g''\right\|. \tag{2.6}
$$

On the other hand, by (2.2) we have

$$
\left|S_{n,p,q}^{*\alpha,\beta}(f;x)\right| \leq \left|S_{n,p,q}^{\alpha,\beta}(f;x)\right| + 2\|f\| \leq 3\|f\|. \tag{2.7}
$$

By (2.2), (2.6), and (2.7), we obtain:

$$
\begin{aligned}
\left|S_{n,p,q}^{\alpha,\beta}(f;x) - f(x)\right| &\leq \left|S_{n,p,q}^{*\alpha,\beta}(f-g;x) - (f-g)(x)\right| + \left|S_{n,p,q}^{*\alpha,\beta}(g;x) - g(x)\right| \\
&\quad + \left|f\left(\frac{[n]_{p,q}x+\alpha}{[n]_{p,q}+\beta}\right) - f(x)\right| \\
&\leq 4\|f-g\| + \frac{\delta_n^2(x)}{pq([n]_{p,q}-1)}\left\|g''\right\| \\
&\quad + \omega\left(f, \frac{\sqrt{(\alpha-\beta x)^2 + [n]_{p,q}([n]_{p,q}+\beta)x^2 + \alpha\beta x}}{[n]_{p,q}+\beta}\right) \\
&= 4\|f-g\| + \frac{\delta_n^2(x)}{pq([n]_{p,q}-1)}\left\|g''\right\| + \omega\left(f, \frac{\gamma_n(x)}{[n]_{p,q}+\beta}\right),
\end{aligned} \tag{2.8}
$$

where

$$
\gamma_{n(x)}^2 = (\alpha-\beta x)^2 + [n]_{p,q}\big([n]_{p,q}+\beta\big)x^2 + \alpha\beta x.
$$

Taking the infimum over all $g \in W^2$ on the right-hand side of (2.8), we obtain

$$\left|S_{n,p,q}^{\alpha,\beta}(f;x)-f(x)\right| \leq CK_2\left(f,\frac{\delta_n^2(x)}{pq([n]_{p,q}-1)}\right)+\omega\left(f,\frac{(\gamma_n)x}{[n]_{p,q}+\beta}\right).$$

Using relation (2.1), for $p,q \in (0,1)$, we get

$$\left|S_{n,p,q}^{\alpha,\beta}(f;x)-f(x)\right| \leq C\omega_2\left(f,\frac{\delta_n(x)}{\sqrt{pq([n]_{p,q}-1)}}\right)+\omega\left(f,\frac{\gamma_n(x)}{[n]_{p,q}+\beta}\right),$$

and this completes the proof. □

3 Rate of approximation

Let $B_{x^2}[0,\infty)$ denote the set of all functions f such that $f(x) \leq M_f(1+x^2)$, where M_f is a constant depending on f. By $C_{x^2}[0,\infty)$ we denote the subspace of all continuous functions in the space $B_{x^2}[0,\infty)$. Also, we denote by $C_{x^2}^*[0,\infty)$, the subspace of all functions $f \in C_{x^2}[0,\infty)$ for which $\lim_{x\to\infty}\frac{f(x)}{1+x^2}$ is finite with

$$\|f\| = \sup_{x\in[0,\infty)}\frac{|f(x)|}{1+x^2}.$$

For $a > 0$, the modulus of continuity of f over $[0,a]$ is defined by

$$\omega_a(f,\delta) = \sup_{|t-x|\leq\delta}\ \sup_{0\leq x,t\leq a}\left|f(t)-f(x)\right|.$$

We have the following proposition.

Proposition 3.1

(i) *For $f \in C_{x^2}[0,\infty)$, the modulus of continuity $\omega_a(f,\delta)$, $a>0$, approaches to zero.*

(ii) *For every $\delta > 0$, we have*

$$\left|f(y)-f(x)\right| \leq \left(1+\frac{|y-x|}{\delta}\right)\omega_a(f,\delta)$$

and

$$\left|f(y)-f(x)\right| \leq \left(1+\frac{(y-x)^2}{\delta^2}\right)\omega_a(f,\delta).$$

In the following theorem, we estimate the rate of convergence of the operators $S_{n,p,q}^{\alpha,\beta}(f;x)$.

Theorem 3.2 *Let $f \in C_{x^2}[0,\infty)$, $p,q \in (0,1)$, and let $\omega_{a+1}(f,\delta)$ be the modulus of continuity on the interval $[0,1+a] \subseteq [0,\infty)$, $a>0$. Then, for $n \geq 2$, we have*

$$\begin{aligned}\left\|S_{n,p,q}^{\alpha,\beta}(f)-f\right\|_{C[0,a]} \leq{}& \frac{4M_f(1+a^2)(2(1+\beta)^2a^2+a+\alpha^2)}{pq([n]_{p,q}-1)}\\&+2\omega_{1+a}\left(f,\left(\frac{2(1+\beta)^2a^2+a+\alpha^2}{pq([n]_{p,q}-1)}\right)^{\frac{1}{2}}\right).\end{aligned}$$

Proof Let $x \in [0,a]$ and $t > a+1$. Since $1+x < t$, we have

$$\begin{aligned} |f(t)-f(x)| &\leq M_f(x^2+t^2+2) \leq M_f(2+3x^2+2(t-x)^2) \\ &\leq M_f(4+3x^2)(t-x)^2 \leq 4M_f(1+a^2)(t-x)^2. \end{aligned} \tag{3.1}$$

For $\delta > 0$, $x \in [0,a]$, $t-1 \leq a$, by Proposition 3.1 we obtain

$$|f(t)-f(x)| \leq \omega_{1+a}(f,|t-x|) \leq \omega_{1+a}(f,\delta)\left(1+\frac{1}{\delta}|t-x|\right). \tag{3.2}$$

By (3.1) and (3.2), for $x \in [0,a]$ and nonnegative t, we can write

$$|f(t)-f(x)| \leq 4M_f(1+a^2)(t-x)^2\omega_{1+a}(f,\delta)\left(1+\frac{1}{\delta}|t-x|\right). \tag{3.3}$$

Therefore,

$$\begin{aligned} &|S^{\alpha,\beta}_{n,p,q}(f;x)-f(x)| \\ &\quad \leq S^{\alpha,\beta}_{n,p,q}(|f(t)-f(x)|;x) \\ &\quad \leq 4M_f(1+a^2)S^{\alpha,\beta}_{n,p,q}((t-x)^2;x)+\omega_{1+a}(f,\delta)\left(1+\frac{1}{\delta}\left(S^{\alpha,\beta}_{n,p,q}((t-x)^2;x)\right)^{\frac{1}{2}}\right). \end{aligned}$$

Hence, using the Lemma 2.2(ii) and the Schwarz inequality, for every $p,q \in (0,1)$ and $x \in [0,a]$, we obtain

$$\begin{aligned} |S^{\alpha,\beta}_{n,p,q}(f;x)-f(x)| &\leq 4M_f(1+a^2)\left(\frac{2(1+\beta)^2x^2+x+\alpha^2}{pq([n]_{p,q}-1)}\right) \\ &\quad + \omega_{1+a}(f,\delta)\left(1+\frac{1}{\delta}\left(\frac{2(1+\beta)^2a^2+a+\alpha^2}{pq([n]_{p,q}-1)}\right)^{\frac{1}{2}}\right) \\ &\leq \frac{4M_f(1+a^2)(2(1+\beta)^2a^2+a+\alpha^2)}{pq([n]_{p,q}-1)} \\ &\quad + \omega_{1+a}\left(1+\frac{1}{\delta}\left(\frac{2(1+\beta)^2a^2+a+\alpha^2}{pq([n]_{p,q}-1)}\right)^{\frac{1}{2}}\right). \end{aligned}$$

By choosing $\delta^2 = \frac{2(1+\beta)^2a^2+a+\alpha^2}{pq([n]_{p,q}-1)}$ we get the required result. □

4 Weighted approximation

This section is devoted to the study of weighted approximation theorems for the operators (2.2).

Theorem 4.1 *Suppose that $p = p_n$ and $q = q_n$ are two sequences satisfying $0 < p_n, q_n < 1$ and suppose that $p_n \to 1$ and $q_n \to 1$ as $n \to \infty$. Then, for each $f \in C^*_{x^2}[0,\infty)$, we have*

$$\lim_{n\to\infty} \|S^{\alpha,\beta}_{n,p_n,q_n}(f)-f\|_{x^2} = 0.$$

Proof By the theorem in [27] it suffices to prove that

$$\lim_{n\to\infty}\left\|S^{\alpha,\beta}_{n,p_n,q_n}\left(t^i\right)-x^i\right\|_{x^2}=0 \quad \text{for } i=0,1,2. \tag{4.1}$$

By Lemma 2.1(i)-(ii), the conditions of (4.1) are easily verified for $i=0$ and 1. For $i=2$, we can write

$$\begin{aligned}
&\left\|S^{\alpha,\beta}_{n,p_n,q_n}\left(t^2\right)-x^2\right\|_{x^2}\\
&\quad=\sup_{x\in[0,\infty)}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(t^2)-x^2|}{1+x^2}\\
&\quad\leq\left(\frac{[n]^3_{p_n,q_n}}{p_nq_n([n]_{p_n,q_n}-1)([n]_{p_n,q_n}+\beta)^2}-1\right)\sup_{x\in[0,\infty)}\frac{x^2}{1+x^2}\\
&\qquad+\frac{[n]^2_{p_n,q_n}+2p_nq_n[n]_{p_n,q_n}([n]_{p_n,q_n}-1)\alpha}{p_nq_n([n]_{p_n,q_n}-1)([n]_{p_n,q_n}+\beta)^2}\sup_{x\in[0,\infty)}\frac{x}{1+x^2}+\frac{\alpha^2}{([n]_{p_n,q_n}+\beta)^2}\\
&\quad\leq\frac{(p_n^n-q_n^n)[n]^2_{p_n,q_n}-p_nq_n(2\beta-1)[n]^2_{p_n,q_n}-q_n\beta(\beta-1)[n]_{p_n,q_n}+q_n\beta^2}{p_nq_n([n]_{p_n,q_n}-1)([n]_{p_n,q_n}+\beta)^2}\\
&\qquad+\left(\frac{[n]^2_{p_n,q_n}+2p_nq_n[n]_{p_n,q_n}([n]_{p_n,q_n}-1)\alpha}{p_nq_n([n]_{p_n,q_n}-1)([n]_{p_n,q_n}+\beta)^2}\right)+\frac{\alpha^2}{([n]_{p_n,q_n}+\beta)^2},
\end{aligned}$$

which implies that

$$\lim_{n\to\infty}\left\|S^{\alpha,\beta}_{n,p_n,q_n}\left(t^2,x\right)-x^2\right\|_{x^2}=0.$$

This completes the proof of the theorem. □

Theorem 4.2 *Let $p=(p_n)$ and $q=(q_n)$ be two sequences such that $0<p_n,q_n<1$, and let $p_n\to 1$ and $q_n\to 1$ as $n\to\infty$. Then, for each $f\in C_{x^2}[0,\infty)$ and all $\alpha>0$, we have*

$$\lim_{n\to\infty}\sup_{x\in[0,\infty)}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(f;x)-f(x)|}{(1+x^2)^{1+\alpha^2}}=0.$$

Proof For $x_0>0$ fixed, we have:

$$\begin{aligned}
\sup_{x\in[0,\infty)}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(f;x)-f(x)|}{(1+x^2)^{1+\alpha^2}}&=\sup_{x\leq x_0}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(f;x)-f(x)|}{(1+x^2)^{1+\alpha^2}}+\sup_{x\geq x_0}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(f;x)-f(x)|}{(1+x^2)^{1+\alpha^2}}\\
&\leq\left\|S^{\alpha,\beta}_{n,p_n,q_n}(f)-f\right\|_{C[0,a]}+\|f\|_{x^2}\sup_{x\geq x_0}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(1+t^2;x)|}{(1+x^2)^{1+\alpha^2}}\\
&\quad+\sup_{x\geq x_0}\frac{|f(x)|}{(1+x^2)^{1+\alpha^2}}.
\end{aligned}$$

The first term of this inequality goes to zero by Theorem 3.2. Also, for any fixed $x_0>0$, it is readily seen from Lemma 2.1 that

$$\sup_{x\geq x_0}\frac{|S^{\alpha,\beta}_{n,p_n,q_n}(1+t^2;x)|}{(1+x^2)^{1+\alpha^2}}$$

approaches zero as $n \to \infty$. If we choose $x_0 > 0$ large enough so that the last part of the last inequality is arbitrarily small, then our theorem is proved. □

5 Voronovskaya-type theorem

This section presents the Voronovskaya-type theorem for the operators $S^{\alpha,\beta}_{n,p,q}(f;x)$. We need the following lemma.

Lemma 5.1 *Suppose that $p_n, q_n \in (0,1)$ are such that $p_n^n \to a, q_n^n \to b$ $(0 \le a, b < 1)$ as $n \to \infty$. Then, for every $x \in [0,\infty)$, simple computations yield*

$$\lim_{n\to\infty} [n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big((t-x);x\big) = \alpha - \beta x,$$
$$\lim_{n\to\infty} [n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big((t-x)^2;x\big) = (1-a)(1-b)x^2 + x.$$

Theorem 5.2 *Assume that $p_n, q_n \in (0,1)$ are such that $p_n^n \to a, q_n^n \to b$ $(0 \le a, b < 1)$ as $n \to \infty$. Then, for $f \in C^*_{x^2}[0,\infty)$ such that $f', f''^*_{x^2}[0,\infty)$, we have*

$$\lim_{n\to\infty} [n]_{p_n,q_n} \big(S^{\alpha,\beta}_{n,p_n,q_n}(f;x) - f(x)\big) = (\alpha - \beta x) f'(x) + \frac{(1-a)(1-b)x^2 + x}{2} f''(x)$$

uniformly on $[0,A]$ for any $A > 0$.

Proof Let $f, f', f'' \in C^*_{x^2}[0,\infty)$ and $x \in [0,\infty)$. By the Taylor formula we can write

$$f(t) = f(x) + (t-x)f'(x) + \frac{1}{2}(t-x)^2 f''(x) + r(t;x)(t-x)^2, \tag{5.1}$$

where $r(t;x)$ is the remainder term, $r(\cdot;x) \in C^*_{x^2}[0,\infty)$, and $\lim_{t\to x} r(t;x) = 0$. Operating by $S^{\alpha,\beta}_{n,p_n,q_n}$ on both sides of (5.1), we get

$$\begin{aligned}
&[n]_{p_n,q_n} \big(S^{\alpha,\beta}_{n,p_n,q_n}(f;x) - f(x)\big) \\
&\quad = [n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big((t-x);x\big) f'(x) + \frac{1}{2}[n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big((t-x)^2;x\big) f''(x) \\
&\qquad + [n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big(r(\cdot;x)(\cdot - x)^2;x\big).
\end{aligned}$$

It follows from the Cauchy-Schwarz inequality that

$$S^{\alpha,\beta}_{n,p_n,q_n}\big(r(\cdot;x)(\cdot - x)^2;x\big) \le \sqrt{S^{\alpha,\beta}_{n,p_n,q_n}(r^2(\cdot;x);x}\sqrt{S^{\alpha,\beta}_{n,p_n,q_n}(r\big((\cdot - x)^4;x\big)}. \tag{5.2}$$

Note that $r^2(x;x) = 0$ and $r^2(\cdot;x) \in C^*_{x^2}[0,\infty)$. Therefore, it follows that

$$\lim_{n\to\infty} S^{\alpha,\beta}_{n,p_n,q_n}\big(r^2(\cdot;x);x\big) = r^2(x;x) = 0 \tag{5.3}$$

uniformly over $[0,A]$.

By Lemma 5.1 and equations (5.2) and (5.3), we obtain

$$\lim_{n\to\infty} [n]_{p_n,q_n} S^{\alpha,\beta}_{n,p_n,q_n}\big(r(\cdot;x)(\cdot - x)^2;x\big) = 0.$$

Thus, we obtain

$$\begin{aligned}
&\lim_{n\to\infty}[n]_{p_n,q_n}\bigl(S^{\alpha,\beta}_{n,p_n,q_n}(f;x)-f(x)\bigr)\\
&\quad=\lim_{n\to\infty}\biggl([n]_{p_n,q_n}S^{\alpha,\beta}_{n,p_n,q_n}\bigl((t-x);x\bigr)f'(x)+\frac{1}{2}[n]_{p_n,q_n}S^{\alpha,\beta}_{n,p_n,q_n}\bigl((t-x)^2;x\bigr)f''(x)\\
&\qquad+[n]_{p_n,q_n}S^{\alpha,\beta}_{n,p_n,q_n}\bigl(r(\cdot;x)(\cdot-x)^2;x\bigr)\biggr)\\
&\quad=(\alpha-\beta x)f'(x)+\frac{(1-a)(1-b)x^2+x}{2}f''(x).
\end{aligned}$$

□

6 Pointwise estimates

In this section, we study pointwise estimates of rate of convergence of the operators $S^{\alpha,\beta}_{n,p,q}(f;x)$.

Let $0<\nu\leq$ and $E\subset[0,\infty)$. We say that a function $f\in C[0,\infty)$ belongs to $Lip(\nu)$ if

$$\bigl|f(t)-f(x)\bigr|\leq M_f|t-x|^{\nu},\quad t\in[0,\infty),x\in E, \tag{6.1}$$

where M_f is a constant depending on α and f only.

We have the following theorem.

Theorem 6.1 *Let $\nu\in(0,1]$, $f\in Lip(\nu)$, and $E\subset[0,\infty)$. Then, for $x\in[0,\infty)$,*

$$\begin{aligned}
&\bigl\|S^{\alpha,\beta}_{n,p,q}(f;x)-f(x)\bigr\|\\
&\quad\leq M_f\biggl\{\biggl(\biggl(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)}-\frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)}\biggr)x^2+\frac{1}{pq([n]_{p,q}-1)}x+\frac{\alpha^2}{([n]_{p,q}+\beta)^2}\biggr)^{\frac{\nu}{2}}\\
&\qquad+2\bigl(d(x,E)\bigr)^{\nu}\biggr\},
\end{aligned}$$

where $d(x,E)$ denotes the distance of the point x from the set E, defined by

$$d(x,E)=\inf\bigl\{|x-y|:y\in E\bigr\}.$$

Proof Taking $y\in\bar{E}$, we can write

$$\bigl|f(t)-f(x)\bigr|\leq\bigl|f(t)-f(y)\bigr|+\bigl|f(y)-f(x)\bigr|,\quad x\in[0,\infty).$$

By (6.1) we have

$$\begin{aligned}
\bigl|S^{\alpha,\beta}_{n,p,q}(f;x)-f(x)\bigr|&=\bigl|S^{\alpha,\beta}_{n,p,q}(f;x)-S^{\alpha,\beta}_{n,p,q}\bigl(f(x);x\bigr)\bigr|\\
&\leq S^{\alpha,\beta}_{n,p,q}\bigl(\bigl|f(t)-f(x)\bigr|;x\bigr)\\
&\leq S^{\alpha,\beta}_{n,p,q}\bigl(\bigl|f(t)-f(y)\bigr|;x\bigr)+S^{\alpha,\beta}_{n,p,q}\bigl(\bigl|f(y)-f(x)\bigr|;x\bigr)\\
&\leq S^{\alpha,\beta}_{n,p,q}\bigl(\bigl|f(t)-f(y)\bigr|;x\bigr)+\bigl|f(x)-f(y)\bigr|\\
&\leq M_fS^{\alpha,\beta}_{n,p,q}\bigl(|t-y|^{\nu};x\bigr)+|x-y|^{\nu}\\
&\leq M_fS^{\alpha,\beta}_{n,p,q}\bigl(|t-x|^{\nu}+|x-y|^{\nu};x\bigr)+|x-y|^{\nu}\\
&\leq M_fS^{\alpha,\beta}_{n,p,q}\bigl(|t-x|^{\nu};x\bigr)+2|x-y|^{\nu}.
\end{aligned}$$

Using the Hölder inequality with $p = \frac{2}{\nu}, q = \frac{2}{2-\nu}$, we obtain

$$\begin{aligned}
&\left|S^{\alpha,\beta}_{n,p,q}(f;x) - f(x)\right| \\
&\quad \le M_f\left\{\left(S^{\alpha,\beta}_{n,p,q}\left(|t-x|^{p\nu};x\right)\right)^{\frac{1}{p}}\left(S^{\alpha,\beta}_{n,p,q}\left(1^q;x\right)\right)^{\frac{1}{q}} + 2\left(d(x,E)\right)^{\nu}\right)\right\} \\
&\quad = M_f\left\{\left(S^{\alpha,\beta}_{n,p,q}\left(|t-x|^2;x\right)\right)^{\frac{\nu}{2}} + 2\left(d(x,E)\right)^{\nu}\right)\right\} \\
&\quad = \left\{\left(\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)} - \frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)}\right)x^2 + \frac{1}{pq([n]_{p,q}-1)}x + \frac{\alpha^2}{([n]_{p,q}+\beta)^2}\right)^{\frac{\nu}{2}} \right. \\
&\qquad \left. + 2\left(d(x,E)\right)^{\nu}\right\},
\end{aligned}$$

and the theorem is proved. □

We now present a theorem regarding a local direct estimate for the operators $S^{\alpha,\beta}_{n,p,q}(f;x)$ in terms of the Lipschitz-type maximal function of order ν as introduced by Lenze [28]. It is defined by

$$\tilde{\omega}_\nu(f;x) = \sup_{y\neq x, y\in[0,\infty)} \frac{|f(y)-f(x)|}{|y-x|^\nu}, \quad x \in [0,\infty), \nu \in (0,1]. \tag{6.2}$$

Theorem 6.2 *Let* $\nu \in (0,1]$ *and* $f \in C[0,\infty)$. *Then, for each* $x \in [0,\infty)$, *we have*

$$\begin{aligned}
&\left|S^{\alpha,\beta}_{n,p,q}(f;x) - f(x)\right| \\
&\quad \le \tilde{\omega}_\nu(f;x)\left\{\left(\frac{[n]_{p,q}}{pq([n]_{p,q}-1)} - \frac{([n]_{p,q}-\beta)}{([n]_{p,q}+\beta)}\right)x^2 + \frac{1}{pq([n]_{p,q}-1)}x + \frac{\alpha^2}{([n]_{p,q}+\beta)^2}\right\}^{\frac{\nu}{2}}.
\end{aligned}$$

Proof By (6.2) we can write

$$\left|f(t) - f(x)\right| \le \tilde{\omega}_\nu(f;x)|t-x|^\nu$$

and

$$\left|S^{\alpha,\beta}_{n,p,q}(f;x) - f(x)\right| \le S^{\alpha,\beta}_{n,p,q}\left(\left|f(t)-f(x)\right|;x\right) \le \tilde{\omega}_\nu(f;x)S^{\alpha,\beta}_{n,p,q}\left(|t-x|^\nu;x\right).$$

Using the Lemma 2.2 and applying the Hölder inequality with $p = \frac{2}{\nu}$, $q = \frac{2}{2-\nu}$, we obtain

$$\left|S^{\alpha,\beta}_{n,p,q}(f;x) - f(x)\right| \le \tilde{\omega}_\nu(f;x)S^{\alpha,\beta}_{n,p,q}\left(|t-x|^\nu;x\right),$$

which proves the theorem. □

Remark The further properties of the operators such as convergence properties via summability methods (see, e.g., [29–31]) can be studied.

7 Conclusions

In this paper, we have introduced a two-parametric (p,q)-analogue of the Stancu-Beta operators and studied some approximating properties of these operators. We also obtained the Voronovskaya-type estimate and the weighted approximation results for these operators. Furthermore, we obtained a pointwise estimate for these operators.
