

REVIEW

Open Access

An overview of clinically and healthcare related apps in Google and Apple app stores: connecting patients, drugs, and clinicians

Samuel Ken-En Gan^{1,2*}, Cornelius Koshy¹, Phi-Vu Nguyen¹ and Yu-Xuan Haw¹

Abstract

Successful clinical outcomes involve both clinician and patient factors such as good decision making, accurate diagnosis, patient compliance, effective monitoring of the condition, and accurate interpretation of clinical results. With a general trend in healthcare towards personalized medicine, the smartphone holds great potential to play a role in personalized care and aid in the above mentioned factors. Through the use of apps, the increasingly powerful smartphone may be a useful aid in the healthcare and clinical industries. This review surveys the currently available apps in Google and Apple app stores that are purposed for aiding healthcare and clinical use, and discusses how they may also help transform the smartphone in a medically relevant device.

Introduction

In ancient times, physicians made house visits to the sick, often administering medical attention within the comforts of the patient's home. Although house-visits do continue to exist today, they are more common in smaller towns or village communities and the very affluent in cities. In the developed world, there is a trend of reversal in the mode of medical care of our forefathers: from doctors attending to patients in their homes, to patients consulting doctors in hospitals.

Such changes have risen out of the necessity for efficiency and improved healthcare. In a hospital/clinic, the concentration of medical expertise, equipment and sanitized environment improves the quality of healthcare over house-visits. Nonetheless, both models of consultation have their own disadvantages. In house visits, the physician's travelling time slows down the immediacy of care and compromises diagnostic accuracy without the necessary medical equipment (e.g. X-Ray machine). On the other hand, we have the very real problem of long

patient waiting hours just for a few minutes of consultation or the collection of test results.

Regardless of the consultation model, today's world offers a solution which overcomes the flaws of each model: the smartphone. With the advancement and incorporation of technology into healthcare, it might be possible to do away with physical visits, especially with video or other imaging technology through smartphones. Patients can get a quick consultation or access their test results with accompanying clinical comments easily. If advanced equipment are required, there might be possibility to leverage on smartphone sensors as simple medical equipment (e.g. microphone as a stethoscope), turning the smartphone into a multi-purpose mobile medical equipment that can be used by both patients and clinicians.

Nonetheless, when dealing with clinical procedures, accuracy and precision outweighs convenience and time. With the growth of technology in medical diagnostics (e.g. electronic ECG, electronic X-Ray), accuracy and efficiency are not necessarily mutually exclusive. Thus, there is potential for the use of apps and wirelessly connected peripheral added sensors to enable the smartphone to change the workings of the healthcare industry.

In spite of this potential and the pockets of activity towards this cause, there is a dearth of literature covering

Table 1 Clinical apps classified in 'communication' (as of Jan 2016)

App name	OS	Description	App type	Hardware
DrBridge	Android	Helps doctors to follow up with patients and deliver care plans through text messaging, email and app-to-app interactions	Hybrid	None
Drchrono EHR/EMR	iOS	Allows doctors to communicate with their patients	Hybrid	None
GatherPro	Android	Allows doctors to communicate with their patients	Hybrid	None
- Patient Portal by ConstantMD		Allows doctors to communicate with their patients		
HealthJump	iOS	Communicates with doctors to schedule appointments	Hybrid	None
Medical & Health Records Caddy	Android & iOS	Manages and share patient list as well as patient tasks, notes, medications, records, images, and messages.	Hybrid	None
Message patient management	iOS	Organises patient and treatment sessions	Hybrid	None
MedBooking	iOS	Allows patients to book their appointments	Hybrid	None
Practo Ray	iOS	Calls Patients for appointments	Hybrid	None
SirenMD	iOS	Sends messages, medical records and photos between health professionals	Hybrid	None

the already available clinical aid apps that both the patient and the clinician can leverage on. To address this, this review discusses the currently available clinically and medically relevant apps and how they might be incorporated into practice for better outcomes.

The future of mobile apps

Efficiency is one of pursuits of excellent healthcare especially in today's growing demands of ageing populations in many developed societies. Incorporating mobile apps with internet connectivity into routine medical processes (e.g. consultations) enhances the convenience for both

doctors and patients alike. In the common problem of long waiting times, registration and appointments can be booked using mobile apps without long queues for the receptionist. Similarly, medical results or clinically relevant pictures taken by patients can be sent through secured apps to physicians and specialists for consultations without the physical transfer of document between hospital departments. With increased efficiency in consultations and diagnosis, patients can be treated earlier, thereby improving prognosis. It might even be possible to do away with face to face outpatient consultations or routine follow-up through the use of apps. Patients can

Table 2 Clinical apps classified in 'patient data management' (as of Jan 2016)

App name	OS	Description	App type	Hardware
Clinic On Go - My Patients	Android	Manages patient information and appointments	Hybrid	None
Doctors Aid - OPD Management	Android	Manages and stores patients' health and medical records	Native	None
- Doctor Assist				
- Doctor Assistant				
- My patients				
- Patient Doctor Records				
Doctor Buddy – Patients Manager	iOS	Manages and stores patient info for Doctors	Native	None
HouseOfficer		Manages and store patient info for Doctors		
Lybrate For Doctors		Manages and store patient info for Doctors		
Hospital Rounds Management	iOS	Stores patient details, diagnosis and billing codes	Native	None
iGrade for psych	iOS	Manages patient info for psychotherapists	Native	None
MDclick for Physicians	iOS	Shares patient info with other health professionals	Hybrid	None
MedicoSA	Android	Enables Physicians to access patient appointments, patient history, and write e-prescriptions	Hybrid	None
OPD MANAGEMENT	Android	Stores information such as Patient History, Patient Diagnosis, and Prescription	Native	None
Patient History Taker	Android	Database app for medical history for patients	Native	None
Practice Management	Android	An application that helps record data of patient	Hybrid	None
Patient Management System	Android	Manages the patient's medical record and able to standardize diagnosis and action.	Native	None
Patient List	iOS	Keeps track on patients' info	Hybrid	None
Prescapp - Doctors	iOS	Manages and stores patient info	Native	None

receive professional consultation through apps in the comfort of their homes, a scenario that is especially beneficial for elderly patients or those with high dependency to getting around.

Displacing medical equipment for lower healthcare costs

The rising costs of healthcare, contributed by the increasing costs of skilled personnel, medical equipment and infrastructure, poses a challenge to accessible healthcare to the less privileged in society. On this problem, the smartphone might help to reduce costs by displacing expensive medical equipment with clinical mobile apps that leverage on the many sensors in smartphones. One such example is the displacement of a heart rate monitor (costing between USD\$70 - \$150) with a free heart rate monitor app that functions via the in-built microphone or camera. Coupled with internet connectivity, one can even easily send results to clinicians, a feature that most current medical equipment lack. Should artificial intelligence be incorporated, these apps may further aid in diagnosis by detecting abnormalities.

Patient compliance

Patient compliance to clinical advice and care is essential for successful clinical outcomes (Martin et al. 2005). The most effective treatment regimens would be rendered ineffective if patients failed to comply. This is particularly true for chronic diseases where patient compliance directly affects disease control. On this aspect, mobile apps that monitor patient conditions and sends reminders of treatment would certainly be a boon for chronic disease management. This is especially so if clinicians can use such apps to monitor disease/symptoms for diagnosis and adjustment of treatment methods.

Clinical mobile apps

In view of the potential for mobile apps in the above-mentioned areas, we did a survey of apps in the Google and Apple app stores using key words: “patient info management”, “patient health monitor”, “eye diagnosis”, “skin diagnosis”, “blood pressure”, “heart beat rate”, “medical calculator” and “patient compliance”. As of early 2016, we found over 1121 and 536 apps in Google Play Store and Apple App Store, respectively. Only about 139 apps of these were directly relevant to practical uses for healthcare. Of these, 30 apps were for patient data management and communication; 44 apps for patient health monitoring; 36 apps for clinical diagnosis; 21 apps for medical calculations; and 7 apps for patient compliance. Within these, we further classified them into nine categories based on their functions.

Table 3 Clinical apps classified in ‘patient health monitors and trackers’ (general health) (as of Jan 2016)

App name	OS	Description	App type	Hardware
Cure companion	Android	Keeps track of patients’ health records	Hybrid	None
Data Manager for Fitbit	iOS	Track health related data such as weight, sleep and body fat	Native	None
HealthTouch	iOS	Records and tracks key health stats	Native	None
iThermonitor	iOS	Monitors the body temperature	Native	None

The various categories of apps relevant to healthcare and medical purposes

Clinical care communication [Table 1]

In healthcare, timely communication between a patient and doctor enables the former to get medical advice and the latter to keep track of the patient condition and intervene when necessary. A range of clinical communication apps have been developed to facilitate better communication between patients and clinicians. One notable example of such apps is ‘Health-Jump’ (Healthjump Inc 2015) which not only allows patients to schedule their appointments with their doctors, but also provides medical records securely.

Patient data management [Table 2]

Patient data management is tantamount for accurate diagnosis/disease management and has to be secured to ensure patient confidentiality. Incomplete or missing reports can result in the loss of crucial information that could have serious clinical consequences (e.g. drug allergies). Apps in this area facilitate the viewing, storage and management of patient data without the spatial constraints of desk-bound medical computer systems. ‘My Patients’ (Evgeny 2015) and ‘Patient Reports Doctor ON GO-T’ (Siyami Apps 2015) are example apps that allow the clinicians to view patients’ medical history, diagnosis and prescription on the go. Such apps make clinical rounds in the ward or house visits much more convenient, doing away with bulky files and folders.

Table 4 Clinical apps classified in ‘patient health monitors and trackers’ (heart rate) (as of Jan 2016)

App Name	OS	Description	App type	Hardware
Cardiograph pro	Android	Saves patient’s daily Blood Pressure and Heart Rate	Native	None
Heart Rate monitor	iOS	Tracks and records heart rate	Native	None
PulsePRO	iOS	Monitors patient heart rate	Hybrid	None

Table 5 Clinical apps classified in ‘patient health monitors and tracker’ (blood pressure) (as of Jan 2016)

App Name	OS	Description	App type	Hardware
Acc. Blood pressure	Android	Keeps track on blood pressure measurements	Native	None
Best Blood Pressure Monitor	iOS	Tracks and automatically collect blood pressure measurements via bluetooth	Native	Tonometer
Blood Pressure	iOS	Manages and track blood pressure progress	Native	None
Blood Pressure (BP) Watch	Android	Collect, track, analyze and share your blood pressure record	Native	None
Blood Pressure Companion	iOS	Tracks Blood pressure, weight and heart health	Native	None
Blood pressure diary	Android	Keeps track on blood pressure records	Native	None
Blood pressure monitor pro	Android & iOS	Keeps track on blood pressure records	Native	None
Blood Pressure log diary	Android	Keeps track on blood pressure records	Native	None
Blood Pressure Tracker	Android	Tracker of Patients’ blood pressure records	Hybrid	None
Blood Pressure PRO	Android	Collect and analyze blood pressure measurements	Native	None
Blood Pressure lite	Android & iOS	helps keep track of blood pressure and weight	Native	None
Blood Pressure + Pulse Grapher lite	iOS	Records blood pressure and pulse rate measurements	Native	None
Bloody Pressure	iOS	Record, track and share blood pressure measurements.	Native	None
HeartStar Blood Pressure Monitor	iOS	Monitors blood pressure and automatically records via bluetooth	Native	none
My Blood Pressure	Android	Records blood pressure measurements taken	Native	None

Besides secured data transmission and data encryption necessary for patient confidentiality, there are other limitations for such apps. One such limitation is the accessibility of file formats where certain medical equipment may store data (e.g. X-Ray, ECG print-outs etc.) in specific file formats not easily accessed on the apps. It is also questionable if the small screen of these mobile devices would allow sufficient analysis of important test results (e.g. small abnormalities in X-Rays). Although difficult viewing conditions may increase human errors, this can be mitigated with image processing algorithms that perform automated diagnostic parameters to detect anomalies.

Patient health monitors and trackers [Tables 3, 4, 5, 6, 7, 8, 9, 10 and 11]

Apps in this category facilitate the recording and monitoring of disease conditions after diagnosis. In the example of hypertension, ambulatory monitoring may enable better diagnosis (Gan et al. 2003) as compared to readings taken at clinics that may be confounded by psychosomatic fear. Some apps in this category can do more to make a comparison analysis with previous data and

alert the user of significant fluctuations in the condition. ‘Blood Pressure Diary’ (FRUCT 2016) and ‘PulsePRO’ (Cocoalena Software 2015) are examples of such apps that record, analyse and send the clinical measurements to attending physicians without the need of an ambulatory machine (typically costing up to hundreds of dollars). With a wide range of types and functions, other apps are also made to track patient’s general health, skin problems, eye problems, blood parameters, menstrual cycles and the presence of diseases. With such monitors and trackers, behavioural changes that improve eating habits and physical activity levels have been observed in young adults. Thus such monitoring apps do encourage patients to be more aware of their daily condition (Higgins 2015).

Heart rate measurement [Table 12]

As a subgroup of the health monitoring apps, heart rate measurement apps form a significant bulk of the group in the mega app stores. Basic heart rate information can be an indicator of general health and aid in both monitoring and detection of cardiac problems. Apps in this category often function like a stethoscope by using the microphone or camera in the smartphones.

Table 6 Clinical apps classified in ‘patient health monitors and trackers’ (skin conditions) (as of Jan 2016)

App name	OS	Description	App type	Hardware
FotoSkin	Android & iOS	Tracks photos of patient’s skin for easy diagnosis of skin cancer for dermatologist.	Hybrid	Camera
Skin Tagger	iOS	Tracks photos of skin pictures	Hybrid	Camera

Table 7 Clinical apps classified in ‘patient health monitors and trackers’ (eye conditions) (as of Jan 2016)

App name	OS	Description	App type	Hardware
Paxos checkup	iOS	Allows patients to monitor their vision and physicians to keep track	Hybrid	None

Table 8 Clinical apps classified in ‘patient health monitors and trackers’ (blood constituent levels) (as of Jan 2016)

App name	OS	Description	App type	Hardware
Calcium Pro	Android	Tracks and monitors the blood calcium, vitamin D levels of Patient for osteoporosis	Native	None
Glucose Buddy : Diabetes Log	Android	Manages Diabetes by tracking glucose levels	Native	None
Glucose Monitor	iOS	Tracks glucose level and weight	Native	None
Iron Tracker – Hemochromatosis	Android	Allows patients to track and monitor their iron levels	Native	None
One Drop	iOS	Manages Diabetes by tracking glucose levels	Native	None

One example, the ‘Cardiograph Heart Rate Monitor’ (BIG DREAMS Lab 2014) app measures the user’s heart rate via the placement of the index finger on the camera. Through the inbuilt camera flash, the app would then track the colour changes on the finger. There is also a significant move in this area towards peripheral devices, where there has been an increase in smart watches (built by major smartphone makers e.g. Apple, Samsung, etc., and other technology companies e.g. Fitbit) that monitors heart rate and send data to the smartphone.

Blood pressure measurement [Table 13]

Similar to measuring heart rate, measuring blood pressure is also another indicator of health status and condition. However unlike heart rate apps, the typical measurement of blood pressure would require the use of peripheral cuff devices connected to the smartphone. Nonetheless one app seems to be able to measure the parameter indirectly without the use of external devices. The ‘Instant Blood Pressure’ (Auralife 2014) relies on in-built camera and flash to provide blood pressure readings. As the technology is protected, it is likely that the dominant apps in this type would be more dependent on peripheral devices.

Table 9 Clinical apps classified in ‘patient health monitors and trackers’ (female menstrual cycle) (as of Jan 2016)

App name	OS	Description	App type	Hardware
Eva Diary	iOS	Tracks patients’ period cycles and ovulation	Native	None
Period Tracker	Android	Helps keep track on menstrual cycle	Native	None
iObstetrics Pro	Android	A tool to allow specialists to monitor and synchronise the progress of every patient’s pregnancy from their Pc, SmartPhone or Tablet.	Hybrid	None

Table 10 Clinical apps classified in ‘patient health monitors and trackers’ (versatile health management) (as of Jan 2016)

App name	OS	Description	App type	Hardware
BloodPressureDB	Android & iOS	Track, monitor and store your blood pressure along with your pulse, blood sugar and BMI	Hybrid	None
BP Wiz	iOS	Tracks Blood pressure, weight and heart health. It also tracks medication	Native	None
Diabetes Manager	iOS	Tracks Blood glucose, blood pressure, weight and etc.	Native	None
Health Tracker & Manager	iOS	Tracks blood glucose and pressure levels	Native	None
Heart Wise Blood Pressure Tracker	iOS	Tracks Blood pressure, weight and heart rate	Native	None
Qardio Heart Health, Weight and Blood Pressure Monitor	iOS	Tracks Blood pressure, weight and heart health	Native	None

Eye diagnosis [Table 14]

Apps in this category leverage on the camera/screen to allow for convenient and quick analysis and storage of eye images and tests. The ‘Colour Blindness Test’ (DaDo 2014) app tests for colour blindness and provides category of colour blindness in the result analysis. Another app such as ‘Pain Eye’ (Medina 2014) helps to investigate eye pain using captured images of the pupil using the smartphone’s camera. Using clip-on peripheral camera adaptors, ‘Peek Retina’ (Peek 2015) was created by a team of eye specialists, software developers, designers and engineers for remote diagnosis. Many apps in this category leverage on the inbuilt

Table 11 Clinical apps classified in ‘patient health monitors and trackers’ (disease, pain and injury) (as of Jan 2016)

App name	OS	Description	App type	Hardware
FIND TB	Android	Supports clinicians in making decisions on the diagnosis and treatment of TB.	Native	Camera
Managing My Hepatitis C	iOS	Monitors patients’ health condition on Hepatitis	Native	None
Mobile REMM	Android & iOS	For clinical diagnosis and treatment of radiation injury during radiological and nuclear emergencies.	Native	None
Pain Stethoscope	Android	Assess and graph patient-reported outcomes of chronic pain management over time.	Native	None

Table 12 Clinical apps classified in ‘heart rate measurement’ (as of Jan 2016)

App name	OS	Description	App type	Hardware
Cardiometer ANT+ Heart Rate	Android	Measures and monitors heart rate	Native	Heart rate Chest Straps
Cardiograph Heart Rate Monitor	Android & iOS	Measures and monitors heart rate	Native	Camera with Flash
Heart Beat Rate	Android	An application to measure heart rate	Native	Camera with Flash
Heart Rate Plus LITE	iOS	Measures and monitors patients’ heart rate	Native	Camera with Flash
Heart Rate Monitor	Android	Measures heart rate via placing your index finger on the phone’s camera len	Native	Camera with Flash
Heart Rate Monitor Ant+	Android	Measures and monitors heart rate	Native	Heart rate Chest Straps
Medtimer	iOS	Measure the time for each heart beat or breath to calculate heart rate	Native	None
iStethoscope Pro	iOS	Records heart beat and showing heart waveform for practioners.	Native	Camera with Flash
Instant Heart Rate	Android & iOS	Measures heart rate via placing your index finger on the phone’s camera len	Native	Camera with Flash
Runtastic Heart Rate Monitor	Android & iOS	Measures heart rate via placing your index finger on the phone’s camera len	Native	Camera with Flash
What’s My Heart Rate	Android & iOS	Measures the heart rate and breath rate through the lens of the camera	Native	Camera

cameras in smartphones, and there is potential for these apps to even aid in detecting abnormalities when coupled with advanced image processing and artificial intelligent algorithms.

Skin diagnosis [Table 15]

Like the ophthalmology apps, skin diagnosis apps leverage on the smartphone inbuilt camera and image processing algorithms. Captured images of the skin are compared against a database of disease images. Apps such as ‘Mole Doctor Skin Cancer App Dermatologist’ (Teodorescu 2014) and ‘Skin Analytics’ (Skin Analytics Development 2014) enable the comparison of mole pictures against skin cancer images. These images can then be sent to dermatologists, making diagnosis more convenient. One limitation of such image based apps is that they are sensitive to the lighting and environmental factors during image capture. Such factors may severely affect the quality of the images and lead to poor diagnostic accuracies.

Medical calculators [Tables 16 and 17]

One frequent clinical mistake that can be fatal in medical treatment is the calculation of dosage. To prevent these mistakes, there are apps available to provide necessary medical calculations, conversions and chemical formulae checks. One such app, ‘Calculate by QxMD’ (QxMD Medical Software Inc 2015) app provides a number of unique calculators specific to various medical specialities and decision support tools including risk analysis. Another example, the Thyroid-SPOT (Sim et al. 2016) apps (Doctor and Patient versions) compute the homeostatic euthyroid set point, guiding the optimization of personalized treatment plans as well as to monitor the patient’s condition. With these apps, more informed patients can also do their part and check their prescription or treatment regimen thus reducing clinical errors.

Patient compliance [Table 18]

As discussed earlier, patient compliance is a key factor in the success of treatment regimens. Considering also that most patients are willing to receive medication

Table 13 Clinical apps classified in ‘blood pressure measurement’ (as of Jan 2016)

App name	OS	Description	App type	Hardware
BP Calculator	Android	Measures the blood pressure and keep record of blood pressure at regular intervals.	Native	None
iBP Blood Pressure	Android & iOS	Blood pressure tracking and analysis tool.	Native	Blood Pressure scrap
iHealth BPM	iOS	Measures blood pressure using a blood pressure dock.	Native	Blood Pressure Dock
Perf.Blood Pressure (BP)Monitor	Android	Calculates and measures your blood pressure via touching thumb on the screen	Native	None

Table 14 Clinical apps classified in 'eye diagnosis' (as of Jan 2016)

App name	OS	Description	App type	Hardware
Anomaloscope	iOS	Tests for colour vision of patients	Native	None
AmslerPro	iOS	Tests for abnormality in the foveal vision	Native	None
Color Blindness Test	Android	Tests for colour blindness	Native	None
Eye Care Plus - Eye Exercises	Android	Contains eye test to check visual acuity and information on eye health	Native	None
Eye Diagnosis	Android	Supports the visualization of eye photographs to help practitioners diagnose eye diseases.	Native	Camera
Eye test	Android	Contains many eye tests including Visual acuity test	Native	None
Eye Test Charts	Android	Tests for visual acuity		
Full Visual Test	Android	Tests for visual acuity		
Vision Test 2.0	Android	Tests for visual acuity		
Morphision	iOS	Qualifies the symptom of distortion in their patient's eyes	Native	None
Pain Eye	iOS	Takes pictures of eyes to diagnose eye pains	Native	Camera
TeleMed	Android	An application that connects to healthcare services and allows sending photos of eye as part of medical teleconsultation.	Hybrid	None
Visual Acuity Test	Android	Monitor acuteness and clearness of vision in person's eyes	Native	None
Vision Test	Android	Includes visual acuity test	Native	None

reminders (Kebede, et al. 2015) and likely to possess smartphones, medication reminder apps can improve compliance. One such example, 'Medisafe Meds & Pill Reminder' (MediSafe™ 2016) monitors and has reminders for scheduled medication times. Such apps are particularly useful for the elderly and those with multiple treatment regimens concurrently.

Discussion

With the smartphone becoming increasingly versatile in different fields of work, there is great promise for its role in the future of personalized medicine. In the current survey of the available apps in the largest apps stores: Google and Apple, we surveyed relevant apps that benefit both clinicians and patients. While there are many apps within the various medical specialities that may exist, they were not covered as focus is given to areas

where patients can play a role, such as taking pictures (skin/eye) for better monitoring and diagnosis. Obviously, certain levels of technical savviness and acceptance from the users (both patient and clinicians) are necessary for the desired benefits of using these apps. The apps surveyed in this review focus on the many clinical aspects with the end-goal of improving the efficiency, cost, simplicity and effectiveness of healthcare. While a horde of apps exist, the majority found in Google and Apple app stores are either glossaries of clinical information apps for health professionals, or basic health knowledge apps for the layman. Even amongst the numerous apps designed for clinical data management and monitoring health, only a minority were found to be of direct practical use. In fact, focusing on the directly practical apps, there is a paucity of evidence-based or professional-informed apps (Majeed-

Table 15 Clinical apps classified in 'skin diagnosis' (as of Jan 2016)

App name	OS	Description	App type	Hardware
Doctor Mole – Skin Cancer App	Android iOS	Automatic analysis of mole images to diagnose skin cancer.	Native	Camera
Mole Checker	iOS	Takes pictures of skin moles and keep track of changes	Native	Camera
Skin Analytics	Android	Takes photos of skin moles and compares for diagnosis of skin cancer	Native	Camera
Skin Cancer App – MySkinPal	Android	Takes photos of skin moles and compares for diagnosis of skin cancer		
SkinVision - Melanoma app	Android	Takes photos of skin moles and compares for diagnosis of skin cancer		
Skin MD Now - Expert Skin Help	Android	Send skin photos to Dermatologists for quick diagnosis.	Hybrid	Camera
Skin Scanner	Android	Takes photos of skin moles for analysis for skin cancer	Hybrid	Camera
SpotMole	Android	Scans photos of skin moles to detect for melanoma	Native	Camera
iDoc24 - Dermatologist Online	Android & iOS	Sends on-demand dermatologist skin photos for diagnosis and monitoring.	Hybrid	Camera

Table 16 Clinical apps classified in 'medical calculators' (calculations) (as of Jan 2016)

App name	OS	Description	App type	Hardware
ACC Guideline Clinical App	Android	Contains interactive tools such as risk scores, dosing calculators, and algorithms.	Native	None
BODE Calculator	Android	Calculates the COPD levels to treat lung diseases.	Native	None
Calculate by QxMD	Android	Includes tools for calculations used in clinical practice.	Native	None
CuidApp - Nurses and Doctors	Android	Includes calculators and unit conversions.	Native	None
CKD Risk Calc Pro	iOS	Evaluates Chronic Kidney Disease via calculations	Native	None
Digoxin Calculator	Android	Estimates a patient's digoxin requirements for the treatment of heart failure.	Native	None
Ezabx	Android	Contains a metric converter and references for common microbes and antibiotics.	Native	None
GRACE 2.0 ACS Risk Calculator	Android	Calculates the probability of fatality after an acute coronary syndrome.	Native	None
GFR & BSA Calculator	Android	Estimates the expected Glomerular filtration rate of patients	Native	None
Haemoscore	Android	Includes score calculators & algorithms to facilitate decision making in both diagnosis and treatment of thrombotic and bleeding problems.	Native	None
MedCalc 3000 Cardiac	Android	Provides medical equations, clinical calculator and dose/unit converters used by Cardiovascular specialists	Native	None
Medical Calculators & Equation	Android	Contains a wide range of calculators/convertors for medical purposes.	Native	None
Medical Formulas	Android & iOS	Medical Calculator that access to main equations, formula and scores used in clinical practice.	Native	None
Medical Tools	Android	Medical calculators, interpretation and scoring systems.	Native	None
Melanoma Visual Risk Calculator	iOS	Calculates the possibility of a mole being a malignant melanoma	Native	Camera
Opioid Converter	Android	Application designed to aid with opioid dose conversions.	Native	None
Ovulation calculator & fertility tracker	iOS	Calculates ovulation cycle and tracks fertility rate	Native	None
Pedia BP	iOS	Blood pressure calculator	Native	None
Pregnancy Calculator	Android	Estimates the expected due date for the born of a baby.	Native	None
Throid-SPOT (Dr and Patient versions)	Android and iOS	Calculates homeostatic euthyroid set points in thyroid diseases	Native	None

Ariss, et al. 2015; Krebs and Duncan 2015; Subhi et al. 2015). One contributing factor for the dearth of apps in certain medical specialties is that certain diagnostic or monitoring procedures may be dependent on peripheral devices (see example of blood pressure and Peek Retina above). Such demands of peripheral devices thus limit the exploitation of smartphones. Other factors include the administration and certification required of medical devices which would vary between countries, and also for the device type. As there are a large number of smartphone models and makers, the in-built sensors in these phones would vary. This results in significant

inter-equipment errors that may prevent any standardized guidelines or procedures required for professional clinical use. These make certification and use of smartphone as medical devices more challenging and unlikely to be approved by various authorities (scope of this is beyond this article due to the varying requirements). In the event they are approved for use, it is likely that many of these smartphone-dependent devices will require skilled personnel. As a result, clinical apps will mostly play a supportive role rather than as direct medical equipment replacements. Such limitations may be slightly mitigated by standardised peripheral devices, but

Table 17 Clinical apps classified in 'medical calculators' (checkers) (as of Jan 2016)

App name	OS	Description	App type	Hardware
Drugs.com Medication Guide	Android	Provides drug information, identify pills, check interactions and set up personal medication records for Health professionals.	Native	None
WebMD	Android	Includes decision-support tools such as WebMD's Symptom Checker.	Native	None

Table 18 Clinical apps classified in 'patient compliance' (as of Jan 2016)

App name	OS	Description	App type	Hardware
Medisafe Meds & Pill Reminder	Android	Add medications, get reminders for taking pills and receive constant tracking of your health progress.	Native	None
Medica Reminders	iOS	Adds medications, get reminders for taking pills and receive constant tracking of your health progress.	Native	None
Pill Alert	iOS			
MyPill	iOS	Birth control pill reminder	Native	None
Pill Reminder	iOS	Reminds patients to take medicine, contraceptive and other medication	Native	None
Pill Monitor Free	iOS	Medication reminder	Native	None

these peripheral devices have their own limitations in accessibility to the general public.

Nonetheless in societies with less stringent medical regulation and where specialized medical equipment may not be readily available, the smartphone certainly has a role not only as a patient companion, but also as a screening tool for health problems. The smartphone has already been shown to aid in numerous areas: patient monitoring, transmission of clinical data between patients and clinicians, encouraging patient compliance, and helping with clinical calculations and decision making. Certainly the patient now has the resources to take better ownership of their own health with such apps (regulatory board approved or not) at their disposal.

Conclusion

With an obvious role in personalized healthcare, the smartphone promises to be a portable medical toolkit/clinical gathering device for both clinicians and patients. Much remains to be done with much more apps and peripheral devices that can be made, but with the collaborative effort between medical specialists, software developers and hardware engineers, the future of the smartphone medical toolkit can be materialized. The days of convenient house-visits might return in the form of app consultations.
