**Fasting Triglycerides Predict Recurrent Ischemic Events in Patients With Acute Coronary Syndrome Treated With Statins**

*J Am Coll Cardiol 2015;65:2267–75*

In the Results section of the Abstract:

...a hazard ratio of 1.51 (95% confidence interval: 1.05 to 2.15) in highest/lowest tertiles (>195/≤135 mg/dl).

should have read:

...a hazard ratio of 1.50 (95% confidence interval: 1.05 to 2.15) in highest/lowest tertiles (>195/≤135 mg/dl).

In the Results section in the Relation of Triglycerides to Short-Term Risk After ACS section:

Relative to the lowest tertile (≤135 mg/dl), adjusted risk in the highest tertile of triglycerides (>195 mg/dl) was 1.50 (95% CI: 1.34 to 1.94) (Figure 3).

should have read:

Relative to the lowest tertile (≤135 mg/dl), adjusted risk in the highest tertile of triglycerides (>195 mg/dl) was 1.50 (95% CI: 1.05 to 2.15) (Figure 3).
