In this paper, we develop some new iterative methods for solving nonlinear equations by using the techniques introduced in Golbabai and Javidi (2007) [1] and Rafiq and Rafiullah (2008) [20]. We establish the convergence analysis of the proposed methods and then demonstrate their efficiency by taking some test problems.

1. Introduction

During the last few years, numerical techniques for solving nonlinear equations have been applied successfully. Recently, there has been some development on iterative methods with higher-order convergence that required the computation of derivatives of as low order as possible (see for example [1–9]).

In this paper, some numerical methods based on the modified homotopy perturbation method are proposed to solve nonlinear equations. The proposed methods are then applied to solve some problems in order to assess their validity and accuracy.

We need the following results.

Theorem 1 ([10]). Suppose $f$ is continuous on $[a, b]$ and differentiable in $(a, b)$. Then there exists a point $\delta \in (a, b)$ such that

$$f(y) = f(x) + (y - x)f'(x) + \frac{1}{2}(y - x)^2f''(\delta).$$

Proof. The proof can be completed by applying Rolle’s theorem for the function

$$\phi(t) = f(y) - f(t) - (y - t)f'(t) - (y - t)^2\theta,$$

where $\theta$ is a constant. □

In the fixed point iterative method for solving the nonlinear equation $f(x) = 0$, the equation is usually rewritten as

$$x = g(x),$$

where

(i) $\exists[a, b]$ s.t. $\forall x \in [a, b]; g(x) \in [a, b]$,

Let (2.1) researchers have applied the method to various linear and nonlinear problems (see for example [11]). Thus He’s method is a universal one which can solve various kinds of nonlinear equations. Subsequently, many asymptotology developed and improved by He and applied to nonlinear oscillators with discontinuities which is, in fact, a coupling of the traditional perturbation method and homotopy in topology [13]. This method was further developed and improved by He and applied to nonlinear oscillators with discontinuities [14], nonlinear wave equations [15], asymptotology [16], boundary value problem [17], limit cycle and bifurcation of nonlinear problems [18] and many other subjects. Thus He’s method is a universal one which can solve various kinds of nonlinear equation. Subsequently, many researchers have applied the method to various linear and nonlinear problems (see for example [12,19]).

Consider the nonlinear equation

\[ f(x) = 0, \quad x \in \mathbb{R}. \]  

(2.1)

We assume that \( w \) is a simple zero of \( f(x) \) and \( \alpha \) is an initial guess sufficiently close to \( w \). Using Theorem 1 around \( \alpha \) for (2.1), we have

\[ f(\alpha) + (x - \alpha)f'(\alpha) + \frac{1}{2}(x - \alpha)^2f''(\delta) = 0, \]

(2.2)

where \( \delta \) lies between \( x \) and \( \alpha \).

We can rewrite (2.2) in the following form:

\[ x = c + N(x), \]

(2.3)

where

\[ c = \alpha - \frac{f(\alpha)}{f'(\alpha)}, \]

(2.4)

and

\[ N(x) = -\frac{1}{2}(x - \alpha)^2\frac{f''(\delta)}{f'(\alpha)}. \]

(2.5)
Now we construct a homotopy (mainly due to Golbabai and Javidi [1]) \( \odot : (\mathbb{R} \times [0, 1]) \times \mathbb{R} \to \mathbb{R} \) for (2.3), which satisfies
\[
\odot (\sigma, \beta, \theta) = \sigma - c - \beta N(\sigma) + \beta (1 - \beta) \theta = 0, \quad \theta, \sigma \in \mathbb{R} \text{ and } \beta \in [0, 1],
\]
(2.6)
where \( \theta \) is unknown real number and \( \beta \) is embedding parameter. It is obvious that
\[
\odot (\sigma, 0, \theta) = \sigma - c = 0, \quad \odot (\sigma, 1, \theta) = \sigma - c - \beta N(\sigma) = 0.
\]
(2.7)
(2.8)
The embedding parameter \( \beta \) increases monotonically from zero to unity as the trivial problem \( \odot (\sigma, 0, \theta) = \sigma - c = 0 \) is continuously deformed to the original problem \( \odot (\sigma, 1, \theta) = \sigma - c - \beta N(\sigma) = 0 \). The modified HPM uses the homotopy parameter \( \beta \) as an expanding parameter to obtain (see [12] and the references therein)
\[
\sigma = x_0 + \beta x_1 + \beta^2 x_2 + \cdots
\]
(2.9)
The approximate solution of (2.1), therefore, can be readily obtained:
\[
w = \lim_{\beta \to 1} \sigma = x_0 + x_1 + x_2 + \cdots
\]
(2.10)
The convergence of the series (2.10) has been proved by He in his paper [12].
For the application of the modified HPM to (2.1), we can write (2.3) as follows, by expanding \( N(\sigma) \) into a Taylor series around \( x_0 \):
\[
\sigma - c - \beta \left\{ N(x_0) + (\sigma - x_0) \frac{N'(x_0)}{1!} + (\sigma - x_0)^2 \frac{N''(x_0)}{2!} + \cdots \right\} + \beta (1 - \beta) \theta = 0.
\]
(2.11)
Substituting (2.9) into (2.11) yields
\[
x_0 + \beta x_1 + \beta^2 x_2 + \cdots - c - \beta \left\{ N(x_0) + (x_0 + \beta x_1 + \beta^2 x_2 + \cdots - x_0) \frac{N'(x_0)}{1!} + \cdots \right\} + \beta (1 - \beta) \theta = 0.
\]
(2.12)
By equating terms with identical powers of \( \beta \), we have
\[
\beta^0 : x_0 = c,
\]
(2.13)
\[
\beta^1 : x_1 = N(x_0) - \theta,
\]
(2.14)
\[
\beta^2 : x_2 = x_1 N'(x_0) + \theta,
\]
(2.15)
\[
\beta^3 : x_3 = x_2 N'(x_0) + \frac{1}{2} x_1^2 N''(x_0),
\]
(2.16)
\[
\beta^4 : x_4 = \frac{1}{6} x_1^3 N'''(x_0),
\]
\[
\beta^5 : x_5 = \frac{1}{24} x_1^4 N''''(x_0),
\]
\[
\vdots
\]
where
\[
N(x_0) = -\frac{[f(\alpha)]^2 f''(\delta)}{2 [f'(\alpha)]^3},
\]
(2.17)
\[
N'(x_0) = \frac{f(\alpha) f''(\delta)}{[f'(\alpha)]^2},
\]
(2.18)
and
\[
N''(x_0) = -\frac{f''(\delta)}{f'(\alpha)}.
\]
(2.19)
Substituting (2.14) into (2.15) and letting \( x_2 = 0 \), we obtain
\[
\theta = \frac{N(x_0) N'(x_0)}{N'(x_0) - 1}.
\]
(2.20)
From (2.4), (2.5) and (2.13)–(2.20), we have

\[ x_0 = \alpha - \frac{f(\alpha)}{f'(\alpha)}. \]

(2.21)

\[ x_1 = -\frac{1}{2} \frac{[f(\alpha)]^2 f''(\delta)}{[f'(\alpha)]^3 - f(\alpha)f'(\alpha)f''(\delta)}. \]

(2.22)

\[ x_2 = 0. \]

(2.23)

\[ x_3 = -\frac{1}{8} \frac{[f(\alpha)]^4 f''(\delta)^3}{[f'(\alpha)]^3 ([f'(\alpha)]^2 - f(\alpha)f''(\delta))^2}. \]

(2.24)

Substituting (2.21)–(2.24) in (2.10), we can obtain the solution of (2.1) as follows:

\[ w = \alpha - \frac{f(\alpha)}{f'(\alpha)} - \frac{1}{2} \frac{[f(\alpha)]^2 f''(\delta)}{[f'(\alpha)]^3 - f(\alpha)f'(\alpha)f''(\delta)} - \frac{1}{8} \frac{[f(\alpha)]^4 f''(\delta)^3}{[f'(\alpha)]^3 ([f'(\alpha)]^2 - f(\alpha)f''(\delta))^2} + \cdots. \]

(2.25)

This formulation allows us to suggest the following iterative method for solving nonlinear equation (2.1).

**Algorithm 1.** For a given \( \omega_0 \), calculate the approximation solution \( \omega_{n+1} \), by the iterative scheme

\[ \omega_{n+1} = \omega_n - \frac{f(\omega_n)}{f'(\omega_n)}; \quad f'(\omega_n) \neq 0. \]

**Algorithm 2.** For a given \( \omega_0 \), calculate the approximation solution \( \omega_{n+1} \), by the iterative scheme

\[ \omega_{n+1} = \omega_n - \frac{f(\omega_n)}{f'(\omega_n)} - \frac{1}{2} \frac{[f(\omega_n)]^2 f''(y_n)}{[f'(\omega_n)]^3 - f(\omega_n)f'(\omega_n)f''(y_n)}; \]

\[ y_n = \omega_n - \frac{f(\omega_n)}{f'(\omega_n)}; \quad f'(\omega_n) \neq 0. \]

**Algorithm 3.** For a given \( \omega_0 \), calculate the approximation solution \( \omega_{n+1} \), by the iterative scheme

\[ \omega_{n+1} = \omega_n - \frac{f(\omega_n)}{f'(\omega_n)} - \frac{1}{2} \frac{[f(\omega_n)]^2 f''(y_n)}{[f'(\omega_n)]^3 - f(\omega_n)f'(\omega_n)f''(y_n)} - \frac{1}{8} \frac{[f(\omega_n)]^4 f''(y_n)^3}{[f'(\omega_n)]^3 ([f'(\omega_n)]^2 - f(\omega_n)f''(y_n))^2}; \]

\[ y_n = \omega_n - \frac{f(\omega_n)}{f'(\omega_n)}; \quad f'(\omega_n) \neq 0. \]

3. Convergence analysis

Now we discuss the convergence analysis of **Algorithm 2**.

**Theorem 4.** Consider the nonlinear equation \( f(x) = 0 \). Suppose \( f \) is sufficiently differentiable. Then for the iterative method defined by **Algorithm 2**, the convergence is at least of order 3.

**Proof.** For the iteration function defined as in **Algorithm 2**, which has a fixed point \( w \), let us define

\[ y = x - \frac{f(x)}{f'(x)}; \]

(3.1)

and

\[ g(x) = x - \frac{f(x)}{f'(x)} - \frac{1}{2} \frac{[f(x)]^2 f''(y)}{[f'(x)]^3 - f(x)f'(x)f''(y)}. \]

(3.2)
Now consider

\[ g'(x) = \frac{f(x)f'''(x)}{[f'(x)]^2} - \frac{f(x)f''(x)f''(y)}{[f'(x)]^3 - f(x)f'(x)f''(y)} - \frac{[f(x)]^2 f'''(x)f'''(y)}{2[f'(x)]^3 - f(x)f'(x)f'''(y)} \]

\[ + \frac{[f(x)]^2 f''(y) \left[ 3 \left[ f'(x) \right]^2 f''(x) - \left[ f'(x) \right]^2 f''(y) - f(x)f''(x)f''(y) - \frac{[f(x)]^2 f''(x)f''(y)}{f'(x)} \right]}{2([f'(x)]^3 - f(x)f'(x)f''(y))^2} \]

(3.3)

\[ g''(x) = \frac{f''(x)}{f'(x)} - \frac{2f(x) \left[ f'''(x) \right]^2}{[f'(x)]^2} - \frac{\left[ f'(x) \right]^3 - f(x)f'(x)f''(y)}{[f'(x)]^3} + \frac{f(x)f'''(x)}{[f'(x)]^3 - f(x)f'(x)f''(y)} - \frac{5 \left[ f(x) \right]^2 f''(x)f'''(y)}{2f'(x)([f'(x)]^3 - f(x)f'(x)f''(y))} \]

\[ + \frac{2f(x)f'''(x)f''(y) \left( 3 \left[ f'(x) \right]^2 f''(x) - f'(x)^2 f''(y) - f(x)f''(x)f''(y) - \frac{[f(x)]^2 f''(x)f''(y)}{f'(x)} \right)}{2([f'(x)]^3 - f(x)f'(x)f''(y))^2} \]

\[ + \frac{[f(x)]^2 f''(y) \left( 3 \left[ f'(x) \right]^2 f''(x) - f'(x)^2 f''(y) - f(x)f''(x)f''(y) - \frac{[f(x)]^2 f''(x)f''(y)}{f'(x)} \right)^2}{2([f'(x)]^3 - f(x)f'(x)f''(y))^3} \]

\[ - \frac{[f(x)]^4 \left[ f'''(x) \right]^2 f'''(y)}{2([f'(x)]^4 \left[ f'''(x) \right]^3 - f(x)f'(x)f''(y))} \]

\[ + \frac{[f(x)]^2 f''(y) \left( 6f(x) \left[ f'(x) \right]^2 - 3f'(x)^2 f'''(x)f''(y) + 3 \left[ f'(x) \right]^2 f'''(x) - f(x)f''(x)f'''(y) \right)}{2([f'(x)]^3 - f(x)f'(x)f''(y))^2} \]

\[ + \frac{[f(x)]^2 f''(y) \left( 3f(x)f'''(x)f'''(y) + \frac{[f(x)]^2 f''(x)f'''(y)}{f'(x)} + \frac{[f(x)]^3 f''(x)f'''(y)}{f'(x)^2} \right)}{2([f'(x)]^3 - f(x)f'(x)f''(y))^2} \]

(3.4)

and

\[ g'''(x) = \frac{f(x)f''(x)}{[f'(x)]^2} + \frac{6f(x) \left[ f'''(x) \right]^3}{[f'(x)]^4} + \frac{3f(x)^2 f'''(x) \left[ f''(x) \right]^3}{[f'(x)]^5 \left[ f'(x) \right]^3 - f(x)f'(x)f'''(y)} \]

\[ - \frac{1}{2} \frac{\left[ f'(x) \right]^5 \left[ f'''(y) \right]^2 \left[ f''(x) \right]^3}{[f'(x)]^3} - \frac{3 \left[ f''(x) \right]^2}{[f'(x)]^2} \]

\[ - \frac{3 \left[ f'(x) \right]^2 f'''(y) \left[ f'(x) \right]^2}{[f'(x)]^3 \left[ f'(x) \right]^3 - f(x)f'(x)f'''(y))^2} \left[ 3 \left[ f'(x) \right]^2 f''(x) - f'(x)^2 f''(y) \right] \]

\[ - f(x)f''(x)f''(y) - \frac{\left[ f'(x) \right]^2 f''(x)f'''(y)}{f'(x)} + \frac{9 \left[ f(x) \right]^2 \left[ f'(x) \right]^2 f''''(y)}{2 \left[ f'(x) \right]^2 \left[ f'(x) \right]^3 - f(x)f'(x)f'''(y)} \]

\[ + \frac{2f''''(x)}{f'(x)} - \frac{6f(x)f''(x)f'''(y)}{[f'(x)]^3 - f(x)f'(x)f''(y)^3} - \frac{6f(x)f''(x)f'''(y)}{[f'(x)]^3} \]

\[ + \frac{3f(x)f''(x)f'''(y)}{[f'(x)]^3 - f(x)f'(x)f''(y)^3} + \frac{3 \left[ f'(x) \right]^2 f''(y)}{[f'(x)]^3 - f(x)f'(x)f''(y)^3} \]

\[ \times \left( 3 \left[ f'(x) \right]^2 f''(x) - f'(x)^2 f''(y) - f(x)f''(x)f''(y) - \frac{[f(x)]^2 f''(x)f'''(y)}{f'(x)} \right) \]
\[
- \frac{f(x)f'''(x)f''(y)}{f'(x)^3} + \frac{1}{2} \left( \frac{f(x)^2 f''(y)}{f'(x)^3} - \frac{f(x)f'(x)f''(y)}{f'(x)^4} \right) \times \left[ 6 \left( f''(x) \right)^3 + 18f'(x)f''(x)f'''(x) + 3 \left( f'(x) \right)^2 f^{(4)}(x) - 3 \left( f''(x) \right)^2 f''(y) \\
- \frac{3f(x) \left( f''(x) \right)^2 f'''(y)}{f'(x)} - 4f'(x)f'''(x)f''(y) - \frac{6 \left( f(x) \right)^2 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^2} \right] + \frac{3f(x) \left( f''(x) \right)^2 f''(y)}{f'(x)} \times \left[ 3 \left( f'(x) \right)^2 f''(x) - \left( f'(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right]^2 \\
+ \frac{3}{2} \frac{f(x)^4 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^3 - f(x)f'(x)f''(y)} \times \left[ 3 \left( f'(x) \right)^2 f''(x) - \left( f'(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right] \\
- \frac{3}{2} \frac{f(x)^4 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^3 - f(x)f'(x)f''(y)} - \frac{4f(x) \left( f''(x) \right)^2 f''(y)}{f'(x)} \times \left[ 3 \left( f(x) \right)^2 f''(x) - \left( f(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right]^2 \\
+ \frac{3}{2} \frac{f(x)^4 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^3 - f(x)f'(x)f''(y)} \times \left[ 3 \left( f'(x) \right)^2 f''(x) - \left( f'(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right] \\
- \frac{9}{2} \frac{f(x)^4 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^3 - f(x)f'(x)f''(y)} - \frac{6f(x)f'(x)f''(y)}{f'(x)} \times \left[ 3 \left( f(x) \right)^2 f''(x) - \left( f(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right]^2 \\
+ \frac{3f(x)f''(x)f''(y)}{f'(x)^2 - f(x)f'(x)f''(y)} \times \left[ 6f(x) \left( f''(x) \right)^2 + 3 \left( f'(x) \right)^2 f''(x) \right] - \frac{3f(x)^2 f'''(y)}{f'(x)} \times \left[ f''(x)^3 + f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right] \\
- \frac{f(x)^2 f'''(y)}{f'(x)} \times \left[ 3f(x) \left( f''(x) \right)^2 f^{(4)}(y) \right. \\
\left. + \frac{3f(x)^4 \left( f''(x) \right)^2 f^{(4)}(y)}{f'(x)^4 - f(x)f'(x)f''(y)} \right] - \frac{3f(x)^3 \left( f''(x) \right)^3 f''(y)}{f'(x)^4 - f(x)f'(x)f''(y)} \times \left[ 2f(x)^2 \left( f''(x) \right)^2 - f(x)f'(x)f''(y) \right]^2 \\
+ \frac{3}{2} \frac{f(x)^3 \left( f''(x) \right)^2 f'''(y)}{f'(x)^3 - f(x)f'(x)f''(y)} \times \left[ 3 \left( f'(x) \right)^2 f''(x) - \left( f'(x) \right)^2 f''(y) - f(x)f''(x)f''(y) - \frac{\left( f(x) \right)^2 \left( f''(x) \right)f'''(y)}{f'(x)} \right]^2 
\]
\[-f(x)f''(x)f'''(y) - \frac{[f(x)]^2 f'''(x)f''(y)}{f'(x)} - \frac{3 [f(x)]^3 f''(x)f'''(y)}{[f'(x)]^2 [f'(x)]^3 - f(x)f'(x)f'''(y)]^3\]
\[\times [3 [f'(x)]^2 f''(x) - [f'(x)]^2 f''(y) - f(x)f''(x)f''(y) - \frac{[f(x)]^2 f''(x)f'''(y)}{f'(x)}]
\[+ \frac{3}{2} \frac{[f(x)]^2 f''(x)f'''(y)}{[f'(x)]^3 - f(x)f'(x)f'''(y)]^3 \left[6 f'(x) [f''(x)]^2 + 3 [f'(x)]^2 f'''(x) - 3 f'(x)f''(x)f''(y) - 3 f'(x)f''(x)f'''(y)
\[-f(x)f''(x)f'''(y) - \frac{[f(x)]^3 [f''(x)]^2 f^{(4)}(y)}{[f'(x)]^3} - \frac{[f(x)]^2 f'''(x)f'''(y)}{f'(x)}\right].\] (3.5)

Thus, one can easily see that
\[g(w) = w, \quad g'(w) = 0 = g''(w), \quad g'''(w) = \frac{2 f'''(w)}{f'(w)}.\] (3.6)

But \(g'''(w) \neq 0\) provides that
\[2 \frac{f'''(w)}{f'(w)} \neq 0,\]
and so, in general, the Algorithm 2 is of order 3. Based on the result (3.6), by using Taylor’s series expansion of \(g(x_n)\) about \(w\) and with the help of (1.2), we obtain the error equation as follows:

\[x_{n+1} = g(x_n)\]
\[= g(w) + g'(w)(x_n - w) + \frac{g''(w)}{2!}(x_n - w)^2 + \frac{g'''(w)}{3!}(x_n - w)^3 + O(x_n - w)^4.\] (3.7)

From (3.6) and (3.7), we get
\[x_{n+1} = w + \frac{g''(w)}{3!} e^3_n + O(e^4_n)\]
\[= w + \frac{1}{6} \left( \frac{2 f''(w)}{f'(w)} \right) e^3_n + O(e^4_n)\]
\[= w + \frac{1}{3} \frac{f''(w)}{f'(w)} e^3_n + O(e^4_n)\]
\[= w + \frac{2 f''(w)}{3 f'(w)} e^3_n + O(e^4_n)\]
\[= w + 2 c_1 e^3_n + O(e^4_n),\]
where \(e_n = x_n - w\) and \(c_3 = \frac{f''(w)}{3 f'(w)}\). Thus,
\[e_{n+1} = 2 c_1 e^3_n + O(e^4_n). \quad \blacksquare\]

4. Applications

Now we present some examples to illustrate the efficiency of the developed method, namely Algorithm 2. The list of examples used is given in Table 1. We compare the classical Newton–Raphson (NR), Weerakoon and Fernando (WF) [9], Özban (OZ) [8], and Homeier (HH) [7] methods with Algorithm 2, as shown in Table 2.

5. Conclusions

The modified homotopy perturbation method due to Golbabai and Javidi [1] is used to develop some numerical methods for solving nonlinear equations. With the help of some examples, comparison of the obtained results with existing methods, such as the classical Newton–Raphson (NR), Weerakoon and Fernando (WF) [9], Özbân (OZ) [8], and Homeier (HH) [7] methods, is also given.

Acknowledgements

We are grateful to the Editor and the referee for their valuable suggestions. We also thank our worthy Rector for providing us with excellent research facilities.
