millions. CONCLUSIONS: Hip and knee arthroplasties represent an important amount of investment for both public and private health care systems in Brazil. These procedures are data to be used in future studies to determine the cost-effectiveness and budgetary impact of different therapies linked to this procedure in Brazil.

PM585 BURDEN OF DISEASE OF OSTEARTHRITIS IN RUSSIA: RESULTS FROM 2011 NATIONAL HEALTH AND WELLNESS SURVEY (NHWS)

Annunziata K1, Chapnick J1, Boldt-Duveby J2

1Kantar Health, New York, NY, USA, 2Kantar Health, Princeton, NJ, USA, *Pfizer, Inc., New York, NY, USA

OBJECTIVES: Osteoarthritis is characterized by joint pain and mobility impairment associated with the gradual wearing of cartilage. Osteoarthritis poses a substantial and increasing burden on society as a result of impaired health-related quality of life and the socio-economic impact. In Russia, there are no solid estimates of the magnitude of the condition. This study is aimed to assess co-morbidity, quality of life (QOL), work/productivity loss, and medical resource utilization in Russian urban adults with osteoarthritis. METHODS: Patients’ self-reported data were collected from 2011 National Health and Wellness Survey (NHWS). Survey samples represented major urban areas in Russia. QOL was measured by the physical component score (PCS) and mental component score (MCS) of the Short Form-12 (SF-12). Loss of productivity was measured by the Work Productivity and Activity Impairment instrument. Medical resource utilization was measured by health care provider, ambulance request and hospitalization in the past 6 months. RESULTS: Of the 10,039 adult respondents, 733 (7.3%) were diagnosed with osteoarthritis (2.2% not diagnosed with osteoarthritis and 98.1% have not experienced arthritis at all). Average age of patients diagnosed with osteoarthritis was 54.1 years. Diagnosed osteoarthritis group reported more co-morbidities (sleep difficulties 51%, high blood pressure 46%, diabetes 44%, asthma 37%, arthritis 30%, high cholesterol 21%), lower mean scores of PCS (40.4 vs 47.3) and similar MCS (43.3 vs 43.8). More patients visited health care providers (83% vs 70%), and a higher percentage were hospitalized (17% vs 9%) over the past 6 months compared to those not expecting arthritis. Furthermore, the osteoarthritis group reported 37.6% impairment in daily activity compared to 25.3% of those not expecting arthritis. All mentioned differences were statistically significant (p<0.05).

CONCLUSIONS: From Russian NHWS results, patients diagnosed with osteoarthritis suffer from impairment in QOL, work/productivity loss and more co-morbidities. Findings indicate there is still an unmet medical need in Russian osteoarthritis patients.

PM566 PAYER COVERAGE ANALYSIS OF CHONDROITIN SULFATE WITH GLUCOSAMINE FOR OSTEOARTHRITIS IN THE UNITED STATES

Stevens CA1, Miller KL1, Goby M1

1PAREXEL Consulting, Walmouth, MA, USA, 2PAREXEL Consulting, Uxbridge, UK

OBJECTIVES: American patient consumers spend in excess of $18 annually on drugs to treat Arthritis. Osteoarthritis is a condition that can lead to Rheumatoid Arthritis. This study looks at how public and private payers in the United States might cover the use of Chondroitin Sulfate with Glucosamine for treating Osteoarthritis. Published coverage policies for products used to treat Osteoarthritis (OA) were gathered and analyzed, along with primary data developed through payer interviews. Interviewees selected included pharmacy directors at private payers and those who administered Medicare Part D plans (N=10). Findings show that payers would provide coverage of chondroitin sulfate with glucosamine for Osteoarthritis if: a) The cost were less than $100/month; b) The Centers for Medicare and Medicaid Services (CMS) would provide coverage; c) Data demonstrated improved outcomes over treatments like omega-3 acid ethyl esters and niacin tablet, film-coated extended-release. Payers also indicated that they would afford chondroitin sulfate with glucosamine with Tier 2 formulary status, similar to that of omega-3 acid ethyl esters and niacin tablet, film-coated extended-release. CONCLUSIONS: Based on our research, we believe U.S. Medicare Part D plans and private payers would cover chondroitin sulfate and chondroitin sulfate with glucosamine products providing there is clinical data demonstrating its efficacy and safety, and assuming that CMS would approve this product as an exception to its coverage policy for nutritional supplements. All payers expressed that currently there are limited or no treatment options for OA patients, implying that a product that showed some statistically significant benefit will be age approved and reimbursed by them. If clinical data shows efficacy in some or all OA patients, we believe the market could provide for a significant price premium as compared to current OTC products.

PM567 FREQUENCY OF OUTPATIENT PHYSIOTHERAPY SERVICES IN TRAUMA DISEASES

Molics B1, Kránicz J1, Schmidt B1, Sebestyén A1, Agoston I1, Cs. Horváth Z2, Marada G2, Roncz I3

OBJECTIVES: The aim of our study is to assess the utilization of out-patient care physiotherapy services related to trauma diseases according to age and gender. METHODS: The data come from the financial data base of the National Health Insurance Fund Administration (in Hungarian: OEP) involving the year of 2009. The data come from the rulebook on the application of the activity code list in out-patient care. The trauma syndromes were reported according to WHO ICD diagnosis code 500-599. We analyzed the medical procedures according to the Hungarian versions of the WHO “International Classification of Procedures in Medicine”. We analyzed the utilization of physiotherapy services according to age and gender. RESULTS: Trauma injuries account for 3471657 cases within the annual number of the physiotherapy-related activities (32318413 cases) showing an approximately 10.5% prevalence. Increasing with age, the number of physiotherapy procedures per 10000 population is on the rise with a national mean value of 3386. There is no significant difference between the mean values in both genders (females=3272, males=3349). The highest number of physiotherapy treatment is provided for the men patients in the age group 55 to 59 (4525) followed by age groups of 35 to 45 with 4235 and 4272 cases. The oldest women age group show the highest value in the year of 2009 (5766), followed by age groups of 75 to 85 with 6057 and 6041 cases per 10000. The number of injury-related cases are higher in men until 49 years of age, but over 50 years of age is higher for women. CONCLUSIONS: In case of the traumatic injuries, the highest demand of the outpatient care physiotherapy services occurred older injured patients. The claim indicators were significantly higher for men and women over 50 years of age.

PM568 AGE AND GENDER DISTRIBUTION OF OUTPATIENT CARE PHYSIOTHERAPY SERVICES FOR TRAUMATIC INJURIES IN HUNGARY
