sharing their records online, members of the PatientsLikeMe® Epilepsy Community tends to over-represent females compared with PharMetrics® (71.7% vs. 53.6%) and 20–50 year old patients, reflecting online user demographics. The proportions of treated patients receiving polytherapy or newer AEDs were also greater in PatientsLikeMe® versus PharMetrics® (53.4% vs. 29.2%, 82.4% vs. 66.4%, respectively). Regional coverage of PatientsLikeMe® members appeared closer to US census than PharMetrics®. Patient-reported data from PatientsLikeMe® reflected the significant burden of epilepsy on patients’ lives. Patients experiencing ≥1 seizure during the last 6 weeks reported significantly lower quality of life (QoL) and health utilities. Eighty-four percent of epilepsy and anxiety than those not reporting seizures (all p-values <0.005). This was even more pronounced in patients reporting ≥1 generalized tonic-clonic seizure (all p-values <0.001). Driving status was clearly impacted by epilepsy, 50.6% in the PatientsLikeMe® sample did not drive (86.2% of these because of epilepsy) and 37.4% of drivers limited their driving because of epilepsy. Patients with driving limitations reported lower health-related QoL and higher levels of anxiety and depression (all p-values <0.0001). CONCLUSIONS: By sharing their records online, members of the PatientsLikeMe® Epilepsy Community provide researchers with a unique source of information. Exploring these data provides insight into the disease burden, treatment patterns and associated outcomes. UC-sponsored.

HEALTH-RELATED QUALITY OF LIFE IMPROVEMENTS WITH DYSPORT IN CERVICAL DYSTONIA
Cooper CM, Chiu S, Copeley-Merrill CM, Masaquel C, Hobbs P
1IPSEN US, Braintree, CA, USA; 2eti Health Solutions, Ann Arbor, MI, USA
In a multicenter, double-blind trial, Dysport 500 units was compared to placebo in the treatment of cervical dystonia. The primary efficacy response was evaluated using the Toronto Western Spasmodic Torticollis Rating Scale (TWSTRS). Pain was evaluated with the Pain subscale of the TWSTRS and a self-reported pain visual analog scale (VAS). HRQOL was evaluated using the SF-36 Health Survey (SF-36). OBJECTIVES: To evaluate improvements in health-related quality of life (HRQoL) in patients with cervical dystonia enrolled in a randomized clinical trial with Dysport™ (also known as abobotulinumtoxinA for Injection in the United States). The outcome was evaluated at weeks 2, 4, 8, 12, and 20 after Dysport treatment. To evaluate HRQOL, changes from baseline to Week 8 on the 8 SF-36 domains, the TWSTRS Pain subscale, and the pain VAS were compared. RESULTS: TWSTRS total scores were significantly improved with Dysport at weeks 4, 8, and 12 (P < 0.013 when compared with placebo). Improvements from baseline to week 8 were seen for all 8 SF-36 domains in the Dysport group. The largest improvements occurred in the Role-Physical and Bodily Pain domains. The placebo group showed some decrease (worsening) in Physical Functioning and little to no change in other SF-36 domains. The differences in mean change scores were statistically significant between the Dysport and placebo groups for 5 of the 8 domains (Physical Functioning, Role-Physical, Bodily Pain, General Health, and Role-Emotional (P ≤ 0.03 for all)). Improvement in the Bodily Pain domain was also supported by significant improvements in the TWSTRS Pain subscale at the pain score at week 4. CONCLUSIONS: The data suggest that HRQOL is improved with Dysport, particularly pain improvement and in the SF-36 Physical Functioning and Role-Physical domains.

ONE YEAR OF NATALIZUMAB TREATMENT IS ASSOCIATED WITH AN IMPROVEMENT IN HEALTH-RELATED QUALITY OF LIFE IN MULTIPLE SCLEROSIS PATIENTS
A9Tsevich A1, Agarwal SS2, Kern DM2, Kadam SA1
1HealthCore, Inc, Wilmington, DE, USA; 2Pharmacy Fulfillment, Wessely, MA, USA
OBJECTIVES: To assess the change in general health-related quality of life (HRQoL) of multiple sclerosis (MS) patients after one year of natalizumab treatment in the usual care setting. MS patients initiating natalizumab therapy were recruited to participate in a longitudinal observational study to assess general health utility of natalizumab in MS patients. The use of the SF-36 in individuals with MS has been evaluated in previous studies. However, more recent literature suggests that the SF-36 may not be an appropriate QoL measure in MS patients. The purpose of this study was to evaluate the SF-36 in MS patients and compare results with previous studies. RESULTS: Data for 324 patients who completed the baseline through 12th month SF-36 assessment were included in this study. The mean age of the patients was 46.5 (SD = 14.3) and the majority of patients were female (75.4%). The mean number of years since MS diagnosis was 10.16 (SD = 8.23). The adjusted PCS score improved significantly from baseline (BL) 43.25, 12th month 46.66, P = 0.001). Similar significant improvements were observed in the adjusted MCS scores (BL 43.13, 12th month 46.77, P = 0.001). CONCLUSIONS: Patients reported improvements in general HRQoL measures after one year of natalizumab treatment in the usual care setting. These results are consistent with results from pivotal clinical trials and document the beneficial impact of natalizumab on HRQoL in MS patients.

THE IMPACT OF EPILEPSY ON ADULT AND PAEDIATRIC PATIENT’S LIVES: A CONCEPTUAL MODEL
Kerr C1, Nixon A2, Angakoskin M2
1Oxford Outcomes Ltd, Oxford, Oxon, UK; 2Tsai, Inc., Woodcliff Lake, NJ, USA
OBJECTIVES: To develop a single conceptual model of the impact of epilepsy on adult and pediatric patients with partial onset seizures to guide the identification of endpoints in clinical trials of new anti-epileptic treatments. METHODS: A literature review to identify qualitative research investigating the impact of partial onset seizures on adult and paediatric patients’ lives. Structured Embase/Medline searches identified 167 abstracts which were screened to identify primary qualitative research among adult and/or pediatric epilepsy patients. Publications were excluded if they did not include partial onset seizures (after excluding generalised seizures), or focused on surgical treatment, were not qualitative research, or were conducted outside of North America/Europe, focused on epilepsy as a secondary condition. 12 adult and 8 pediatric qualitative studies were identified. Relevant results were extracted into structured tables. Results from both samples were synthesised into a conceptual model by two experienced qualitative researchers. RESULTS: Twenty-three concepts were identified from the reviewed literature. Concepts were largely universal between adult and pediatric patients, although some concepts varied between adults and pediatric, for example paediatric relationship concerns were focused on rejection in friendships and trouble developing relationships. For adults the concerns were problematic relationships with spouse or partner, fulfilling family roles and problems having children. CONCLUSIONS: The conceptual model identifies important impacts of epilepsy from the patient perspective. The model also demonstrates areas of patients’ lives that may potentially be enhanced through improvement of epilepsy symptoms. As a result, the model allows for concepts of concern to both adult and pediatric patients to be identified and explored as potential patient-reported endpoints in clinical trials of new antiepileptic treatments.

THE HEMOPHILIA UTILIZATION GROUP STUDY (HUGS-VB): HEALTH-RELATED QUALITY OF LIFE IN HEMOPHILIA B
Poon R1, Lo M2, Drost J3, Zhoo ZY3, Gudwary-Sridhar F3, Baker J3, Ullman M3, Geerpri M4, Johnson K5
1USC School of Pharmacy, Los Angeles, CA, USA; 2University of Western Ontario, London, ON, Canada; 3UCCLA Division of Hematology/Oncology, Los Angeles, CA, USA; 4University of Texas Health Science Center at Houston, Houston, TX, USA; 5UCSF HTC, San Francisco, CA, USA
OBJECTIVES: To describe health-related quality of life (HRQoL) and health utility of persons with hemophilia B, and to determine the association of these measures with self-reported joint pain and motion limitation. METHODS: The prospective, institutional Hemophilia Utilization Group Study (HUGS-VB) recruited participants with hemophilia B from six U.S. Hemophilia Treatment Centers from June 2009 to September 2010. At initial interview, participants or their parent(s) answered questions regarding demographic and clinical characteristics, HRQoL, health utility and self-reported joint pain and motion limitation. HRQoL measures included Short Form-12 (SF-12) for adults and PedsQL for children. Health utility measures used were EQ-5D (adults) and visual analog scale (VAS). RESULTS: Seventy-seven participants (48% adults) were recruited. Adult mean SF-12 mental (MCS-12) and physical (PCS-12) component scores were 54.3 (±13.8) and 47.1 (±13.1) respectively. Participants with mild/moderate hemophilia (mean = 50.4±9.0) had significantly better PCS-12 scores than those with severe hemophilia (mean = 42.6±12.4) (P = 0.0390). EQ-SD and VAS scores were 0.85 (±0.16) and 85.5 (±11.1) respectively with no significant differences between severity groups. PCS-12 and EQ-SD were negatively correlated with self-reported joint pain (PC-12: P = 0.0017; EQ-SD: P = 0.0017) and motion limitation (PC-12: P = 0.0001; EQ-SD: P = 0.0011, better HRQoL was associated with less severe pain or limitation. Pediatric mean total PedsQL score was 50.6 (±11.2) with patients with self-reported joint pain and psychosocial functioning summary scores of 92 (±14.9) and 82 (±13.3) respectively. Mean VAS score was 86.8 (±14.3). No significant differences were found between severity groups. SF and VAS scores each negatively correlated with self-reported joint pain (PF: P = 0.0127; VAS: P = 0.0245) and motion limitation (PF: P = 0.0009; VAS: P = 0.0015). CONCLUSIONS: While previous HRQoL studies have examined hemophilia A and its associated clinical aspects, this is the first focusing on the hemophilia B population. As hemophilia A and B may have different clinical manifestations, HRQoL data on hemophilia B can help define disease burden in this group. One limitation is the current small sample size, which will increase as additional participants continue to be enrolled.

MEASUREMENT CHARACTERISTICS OF THE SF-36 IN CHRONIC NEUROMUSCULAR DISORDER
Janks PA1, Martin CJ1, Pety P1
1University of the West of Scotland, Hamilton, UK; 2University of the West of Scotland, Ayr, UK; 3Southern General Hospital, Glasgow, UK
OBJECTIVES: Quality of life (QoL) remains an important consideration in the care of patients suffering with chronic neuromuscular disorder (NMD). The factor structure of the SF-36 was evaluated in patients with NMD in order to determine the appropriateness of this instrument to assess QoL in this clinical population. METHODS: Confirmatory factor analyses were conducted on self-report SF-36 data from 166 individuals’ diagnosis with a NMD. The structural models of the SF-36 were evaluated against data. RESULTS: The underlying factor structure of the SF-36 in NMD was observed to be consistent with contemporary theoretical models of the instrument. The traditional measurement model of SF-36, however, performed comparatively poorly. CONCLUSIONS: The use of the SF-36 in individuals with
