BACKGROUND: Health Economic Evaluations (HEE) on public health issues may be excluded from the decision-making (DM) process, even when they provide additional insights and support decision-making (DM). This article is part of the ‘Evaluating Communication Strategies to Support Informed Decisions and Decision Making’ (ECDIME) project funded by the European Commission, which aims to support the European Commission to promote a better understanding of the DM process and decision support tools (DSTs) within the EU. The project focuses on public health issues such as the increased use of health services and increased costs of care. The article aims to contribute to the dissemination of HEE and its role in supporting decision-making (DM).

Methods: The article describes the procedures and processes used in the ECDIME project to promote the implementation of HEE in decision-making (DM) processes. The key stakeholders involved in the project are presented, and the main objectives and goals are outlined. The article also discusses the challenges faced in promoting HEE and the strategies used to address these challenges. The article concludes with a discussion of the potential impact of the ECDIME project on the implementation of HEE in decision-making (DM) processes.
