The authors regret the following footnote should have been included with Table 6:

In cases where Chloramphenicol is used (known anaphylaxis to penicillins or cephalosporins) the dose may be reduced to 12.5 mg/kg 6 hourly if the patient is recovering, to reduce the risk of a dose-related anaemia.

Table 6 is reproduced again here with the addition of the footnote.

The authors would like to apologise for any inconvenience caused.

Table 6 Definitive antibiotic treatment.

Aetiology	Antibiotic (s)	Dose	Alternative antibiotic choices	Dose	Duration ^b
<i>Neisseria meningitidis</i>	Cefotaxime OR Ceftriaxone	2 g 6 hourly/2 g 12 hourly	Chloramphenicol (if anaphylaxis) OR Benzylpenicillin	25 mg/kg 6 hourly 2.4 g 4 hourly	5 days
<i>Streptococcus pneumoniae</i> (sensitivities unknown or penicillin resistant, cephalosporin sensitive)	Cefotaxime ^a OR Ceftriaxone ^a	2 g 6 hourly 2 g 12 hourly	Chloramphenicol	25 mg/kg 6 hourly	10 days (if stable) Up to 14 days if taking longer to respond
<i>Streptococcus pneumoniae</i> (penicillin sensitive, MIC ≤ 0.06)	Benzylpenicillin OR Cefotaxime OR Ceftriaxone ^c	2.4 g 4 hourly 2 g 6 hourly/2 g 12 hourly	Chloramphenicol	25 mg/kg 6 hourly	10 days (if stable) Up to 14 days if taking longer to respond
<i>Streptococcus pneumoniae</i> (penicillin and cephalosporin non-susceptible, penicillin MIC > 0.06 or cefotaxime/ ceftriaxone MIC > 0.5)	Cefotaxime OR Ceftriaxone AND Vancomycin ^d OR Rifampicin	2 g 6 hourly 2 g 12 hourly 15–20 mg/kg 12 hourly (adjusting according to serum trough levels) 600 mg bd	Chloramphenicol ^e	25 mg/kg 6 hourly	14 days
<i>Listeria monocytogenes</i>	Amoxicillin	2 g 4 hourly	Co-trimoxazole	10–20 mg/kg (of the trimethoprim component) in 4 divided doses	21 days
<i>Haemophilus influenzae</i>	Cefotaxime OR Ceftriaxone	2 g 6 hourly 2 g 12 hourly	Moxifloxacin	400 mg od	10 days

^a Add in IV Vancomycin 15–20 mg/kg bd or Rifampicin 600 mg bd if penicillin resistance is suspected e.g. patient has recently arrived from a country where penicillin resistant pneumococci is prevalent (if unsure, check with local infectious diseases/microbiology expertise).

^b Treatment durations may need to be extended if patient is not responding.

^c If low risk of *Clostridium difficile* infection and/or requiring outpatient therapy.

^d Serum vancomycin trough concentrations of 15–20 µg/ml should be aimed for.

^e In cases where Chloramphenicol is used (known anaphylaxis to penicillins or cephalosporins) the dose may be reduced to 12.5 mg/kg 6 hourly if the patient is recovering, to reduce the risk of a dose-related anaemia.
