OBJECTIVES: A systematic review of the literature was performed to gather all official recommendations on the prevention in infants of allergic manifestations (AMs). The aim was to define the best possible level of nutritional support and to inform decisions about reimbursement coverage, and 2) the reality of how products are used in clinical practice. The aim of this study is to explore the issue of divergence between actual and evaluated drug pathways and resultant consequences are used in clinical practice. The aim of this study is to explore the issue of divergence between actual and evaluated drug pathways and resultant consequences are used in clinical practice. The aim of this study is to explore the issue of divergence between actual and evaluated drug pathways and resultant consequences are used in clinical practice. The aim of this study is to explore the issue of divergence between actual and evaluated drug pathways and resultant consequences are used in clinical practice.
