KEYWORDS
Mixed convection; Immiscible fluids; Corrugated channel; Traveling thermal waves; Perturbation method

Abstract Fully developed laminar mixed convection in a corrugated vertical channel filled with two immiscible viscous fluids has been investigated. By using a perturbation technique, the coupled nonlinear equations governing the flow and heat transfer are solved. The fluids are assumed to have different viscosities and thermal conductivities. Separate solutions are matched at the interface using suitable matching conditions. The velocity, the temperature, the Nusselt number and the shear stress are analyzed for variations of the governing parameters such as Grashof number, viscosity ratio, width ratio, conductivity ratio, frequency parameter, traveling thermal temperature and are shown graphically. It is found that the Grashof number, viscosity ratio, width ratio and conductivity ratio enhance the velocity parallel to the flow direction and reduce the velocity perpendicular to the flow direction.

1. Introduction

Mixed convection is defined as a heat transfer situation where both natural convection and forced convection heat transfer mechanisms interact. In the past thirty years, mixed convection in a vertical heated channel has received considerable attention due to its extensive practical applications, including turbine rotor blade internal cooling systems, cooling of nuclear reactors and electronic components. From a technological point of view, the study of viscous fluids bounded by corrugated surfaces is of special interest and has practical applications in the cooling of electronic devices and systems, enhancing the heat transfer efficiency of industrial transport processes. The problem of viscous flow in a wavy channel was first treated analytically by Burns and Parks (1967). Later on Goldstein and Sparrow (1977), O’Brien and Sparrow (1982), Vajravelu (1989) and Saniei and Dini (1993) studied the flow through a corrugated channel.

Wang and Vanka (1995) determined the rates of heat transfer for flow through a periodic array of wavy passages. Malashetty et al. (2001a) studied the magnetoconvective flow and heat transfer between a vertical wavy wall and a parallel flat wall. Wang and Chen (2001) analyzed the rate of heat transfer for flow through a sinusoidal curved channel. A numerical study of mixed convection heat and mass transfer along a vertical wavy surface has been carried out by Jang and Yan (2004). Yao (2006) used finite difference methods to analyze the problem of natural convection boundary layer flow along a complex vertical surface represented by two sinusoidal functions. He found that the total heat-transfer rates for a complex surface are greater than those for a flat surface. Kuhn
The application of the two-fluid model is dependent on the presumed interface shape (either plane or curved) and on the availability of reliable closure relations for the wall shear and interfacial shear stresses (averaged over the corresponding wetted perimeter) in terms of the local/instantaneous holdup and velocities. These closure relations should correctly represent the effects of the system’s parameters (e.g., fluids’ flow rates and physical properties).

Meyer and Garder (1954) were the first authors to publish a paper on the mechanics of two immiscible fluids in porous media. Loharsabi and Sahai (1998) analyzed the flow of two immiscible fluids in a parallel plate channel assuming the continuity of velocity and thermal equilibrium at the interface. Several researchers have assumed that separated two-phase flow can be well represented by the superimposition of two single-phase flows separated by a flat interface. The first exact solution for the fluid flow in the interface region was presented in Vafai and Kim (1990). In that study, the shear stress in the fluid and the porous medium were taken to be equal at the interface region. Using this assumption, Malashetty and Leela (1992), Malashetty et al. (2001b, 2004), Umavathi et al. (2005, 2007, 2008a, b) and Prathap Kumar et al. (2011a, b) studied the flow and heat transfer of different immiscible fluids through channels. Most recently Umavathi and Shekar (2011, 2012) studied the mixed convection flow of immiscible fluids in a vertical corrugated channel.

In the literature, numerous experimental and theoretical studies have been reported concerning the heat transfer in the corrugated surface for the one-fluid model. Keeping in view the various applications of the two-fluid model, we were motivated to analyze the flow nature of two immiscible fluids in a vertical corrugated channel for unsteady flow. The temperature and velocity distributions are simulated by the perturbation method.
Mixed convective flow of immiscible fluids in a vertical corrugated channel with traveling thermal waves

2. Mathematical formulation of the problem

We consider a two dimensional unsteady laminar mixed convective flow of two immiscible, incompressible fluids in a vertical wavy channel as shown in Fig. 1. The $X$-axis is taken parallel to the wavy wall, while the $Y$-axis is taken perpendicular to it in such a way that the left wavy wall is represented by $Y = -h^0 + a \cos(\lambda X + \theta)$ and the right wavy wall by $Y = h^0 + a \cos(\lambda X)$. The values of $\theta = 0, \pi/2, \pi$ and $3\pi/2$ represent different configurations of the wavy channels such as:

(i) the crest of a wall corresponds to the crest of the other wall of the channel;
(ii) one of the walls considered in (i) has a phase-advance/lag;
(iii) the crest of the wall corresponds to the trough of the other; and
(iv) one of the walls considered in (iii) has a phase-advance/lag.

The left and right walls are maintained at constant temperature $T_1$ and $T_2$ respectively. The region $-h^0 + a \cos(\lambda X + \theta) \leq Y \leq 0$ (region-I) is occupied by a fluid of density $\rho^0$, viscosity $\mu^0$, thermal conductivity $K^0$, thermal expansion coefficient $\beta^0$, specific heat at a constant temperature $C_p^0$ and the region $0 \leq Y \leq h^0 + a \cos(\lambda X)$ (region-II) is occupied by the fluid of density $\rho^2$, viscosity $\mu^2$, thermal conductivity $K^2$, thermal expansion coefficient $\beta^2$, specific heat at a constant temperature $C_p^2$. The fluids properties are assumed to be constant except the density in the buoyancy term in the momentum equation. The fluid rises in the channel driven by buoyancy forces. The transport properties of both the fluids are assumed to be constant. The wave length of the wavy wall which is proportional to $1/\lambda$ is very large, where $\lambda$ is the wave length. Since our model is general, one can choose any two different fluids which are immiscible.

We consider the fluid to be incompressible and the flow is unsteady, laminar, and two-dimensional (that is, the flow is identical in vertical layers, which is a valid assumption). It is assumed that the only non-zero component of the velocity is the $X$-component $U^{(i)}(i = 1, 2)$. Thus, with these assumptions, the continuity equations, the momentum equations, and the energy equations are in the form

\[
\frac{\partial U^{(1)}}{\partial X^{(1)}} + \frac{\partial V^{(1)}}{\partial Y^{(1)}} = 0
\]

\[
\rho^{(1)} \left( \frac{\partial U^{(1)}}{\partial t^{(1)}} + U^{(1)} \frac{\partial U^{(1)}}{\partial X^{(1)}} + V^{(1)} \frac{\partial U^{(1)}}{\partial Y^{(1)}} \right) = -\frac{\partial \rho^{(1)}}{\partial X^{(1)}} + \mu^{(1)} \left( \frac{\partial^2 U^{(1)}}{\partial X^{(1)} \partial X^{(1)}} + \frac{\partial^2 U^{(1)}}{\partial Y^{(1)} \partial Y^{(1)}} \right) - \rho^{(1)} g
\]

\[
\frac{\partial V^{(1)}}{\partial t^{(1)}} + U^{(1)} \frac{\partial V^{(1)}}{\partial X^{(1)}} + V^{(1)} \frac{\partial V^{(1)}}{\partial Y^{(1)}} = -\frac{\partial P^{(1)}}{\partial Y^{(1)}} + \mu^{(1)} \left( \frac{\partial^2 V^{(1)}}{\partial X^{(1)} \partial X^{(1)}} + \frac{\partial^2 V^{(1)}}{\partial Y^{(1)} \partial Y^{(1)}} \right)
\]

\[
\rho^{(1)} C_p^{(1)} \left( \frac{\partial T^{(1)}}{\partial t^{(1)}} + U^{(1)} \frac{\partial T^{(1)}}{\partial X^{(1)}} + V^{(1)} \frac{\partial T^{(1)}}{\partial Y^{(1)}} \right) = K^{(1)} \left( \frac{\partial^2 T^{(1)}}{\partial X^{(1)} \partial X^{(1)}} + \frac{\partial^2 T^{(1)}}{\partial Y^{(1)} \partial Y^{(1)}} \right)
\]

\[
\rho^{(1)} = \rho_0 (1 - \beta^{(1)} (T^{(1)} - T_i))
\]

\[
\frac{\partial U^{(2)}}{\partial X^{(2)}} + \frac{\partial V^{(2)}}{\partial Y^{(2)}} = 0
\]

\[
\rho^{(2)} \left( \frac{\partial U^{(2)}}{\partial t^{(2)}} + U^{(2)} \frac{\partial U^{(2)}}{\partial X^{(2)}} + V^{(2)} \frac{\partial U^{(2)}}{\partial Y^{(2)}} \right) = -\frac{\partial P^{(2)}}{\partial X^{(2)}} + \mu^{(2)} \left( \frac{\partial^2 U^{(2)}}{\partial X^{(2)} \partial X^{(2)}} + \frac{\partial^2 U^{(2)}}{\partial Y^{(2)} \partial Y^{(2)}} \right) - \rho^{(2)} g
\]
\[ \rho^2 \left( \frac{\partial V^2}{\partial Y^2} + U^2 \frac{\partial V^2}{\partial X^2} + V^2 \frac{\partial V^2}{\partial Y^2} \right) \]
\[ = - \frac{\partial P^2}{\partial Y^2} + \mu^2 \left( \frac{\partial^2 V^2}{\partial X^2} + \frac{\partial^2 V^2}{\partial Y^2} \right) \]  
(8)

\[ \rho^2 C_p^2 \left( \frac{\partial T^2}{\partial Y^2} + U^2 \frac{\partial T^2}{\partial X^2} + V^2 \frac{\partial T^2}{\partial Y^2} \right) \]
\[ = K^2 \left( \frac{\partial^2 T^2}{\partial X^2} + \frac{\partial^2 T^2}{\partial Y^2} \right) \]  
(9)

\[ \rho^2 = \rho_0 \left(1 - \beta^2 (T^2 - T_i)\right) \]  
(10)

A characteristic feature of the two-layer flow problem is the coupling across liquid/liquid interfaces. Interfacial relations can be very complicated for certain practical applications. This is mainly due to the terms arising from mass transfer and from normal stresses. The former contributes as a thrust force due to the density change in the mechanical boundary conditions. The latter introduces complicated coupling effects of the flow fields with the thermodynamic properties at the interface. The liquid layers are mechanically coupled via transfer of momentum across the interfaces. Transfer of momentum results from the continuity of interface tangential velocity and from a stress balance across the interface. Together with these two conditions, continuity of pressure gradient along the flow direction at a liquid–liquid interface is assumed. Thermal coupling is achieved through the continuity of temperature at the interface and the balance of heat transfer across the interface. Along with these there is a “no-slip” condition and a constant temperature at the boundaries. With these assumptions the boundary and interface conditions become

\[ U^1 = V^1 = 0 \quad \text{at} \quad Y = -h^1 + a \cos(\lambda X + \theta) \]

\[ U^2 = V^2 = 0 \quad \text{at} \quad Y = h^2 + a \cos(\lambda X) \]

\[ U^1 = U^2, \quad V^1 = V^2 \quad \text{at} \quad Y = 0 \]  
(11)

\[ \frac{\partial P^1}{\partial X^2} = \frac{\partial P^2}{\partial X^2} \quad \text{at} \quad Y = 0 \]

\[ T^1 = T_1(1 + a \cos(\lambda X + \omega t)) \]

\[ = \tilde{T}_1 \quad \text{(say)} \quad \text{at} \quad Y = -h^1 + a \cos(\lambda X + \theta) \]

\[ T^2 = T_2(1 + a \cos(\lambda X + \omega t)) \]

\[ = \tilde{T}_2 \quad \text{(say)} \quad \text{at} \quad Y = h^2 + a \cos(\lambda X) \]  
(12)

The boundary conditions on the temperature field physically indicate that there are traveling thermal waves moving in a negative X-direction.

We next introduce the non-dimensional flow variables as

\[ x^1 = \frac{X^1}{h^1}, \quad y^1 = \frac{Y^1}{h^1}, \quad x^2 = \frac{X^2}{h^2}, \quad y^2 = \frac{Y^2}{h^2}, \]

\[ u^1 = \frac{h^1}{\nu^1}(U^1), \quad v^1 = \frac{h^1}{\nu^1}(V^1), \]

\[ u^2 = \frac{h^2}{\nu^2}(U^2), \quad v^2 = \frac{h^2}{\nu^2}(V^2), \quad \rho^1 = \frac{\rho^1}{\rho^1(h^1/h^2)}, \]

\[ \rho^2 = \frac{\rho^2}{\rho^2(h^1/h^2)} \]

\[ T^1 = \frac{T^1 - \tilde{T}_1}{T_2 - \tilde{T}_1}, \quad T^2 = \frac{T^2 - \tilde{T}_1}{T_2 - \tilde{T}_1}, \quad \beta = \frac{\beta^2}{\beta^1}, \quad h = \frac{h^2}{h^1}, \]

\[ m = \frac{\mu^1}{\mu^2}, \quad r = \frac{\rho^2}{\rho^1}, \quad \gamma^2 = \left( \frac{\gamma v^2}{k} \right)^{(1)}, \]

\[ \gamma^2 = \left( \frac{\gamma v^2}{k} \right)^{(2)}, \quad \beta = \frac{\beta^2}{\beta^1}, \quad \tilde{T}_1 \quad \text{at} \quad region I, \quad \tilde{T}_2 \quad \text{at} \quad region II. \]

In terms of these non-dimensional variables, the basic Eqs. (1), (4), (6)–(9) can be expressed in the dimensionless form as, (for simplicity, the notation is considered as \( x^1 = x; \ y^1 = y; \ t^1 = t \) in region-I and \( x^2 = x; \ y^2 = y; \ t^2 = t \) in region-II).

Region-I

\[ \frac{\partial u^1}{\partial x^1} + \frac{\partial v^1}{\partial y^1} = 0 \]  
(14)

\[ \frac{\partial u^1}{\partial t^1} + u^1(\frac{\partial u^1}{\partial x^1} + \frac{\partial v^1}{\partial y^1}) = - \frac{\partial \mu^1}{\partial x^1} + \frac{\partial^2 u^1}{\partial x^2} + \frac{\partial^2 v^1}{\partial y^2} + Gr T^1 \]  
(15)

\[ \frac{\partial T^1}{\partial t^1} + u^1(\frac{\partial T^1}{\partial x^1} + \frac{\partial v^1}{\partial y^1}) = - \frac{\partial \mu^1}{\partial y^1} + \frac{\partial^2 v^1}{\partial x^2} + \frac{\partial^2 v^1}{\partial y^2} \]  
(16)

\[ \frac{\partial^2 T^1}{\partial x^2} + \frac{\partial^2 T^1}{\partial y^2} = \frac{1}{Pr} \left( \frac{\partial^2 T^1}{\partial x^2} + \frac{\partial^2 T^1}{\partial y^2} \right) \]  
(17)

Region-II

\[ \frac{\partial u^2}{\partial x^2} + \frac{\partial v^2}{\partial y^2} = 0 \]  
(18)

\[ \frac{\partial u^2}{\partial t^2} + u^2(\frac{\partial u^2}{\partial x^2} + \frac{\partial v^2}{\partial y^2}) = - \frac{\partial \mu^2}{\partial x^2} + \frac{\partial^2 u^2}{\partial x^2} + \frac{\partial^2 v^2}{\partial y^2} + Gr \beta h^3 m^2 r T^2 \]  
(19)

\[ \frac{\partial v^2}{\partial t^2} + u^2(\frac{\partial v^2}{\partial x^2} + \frac{\partial v^2}{\partial y^2}) = - \frac{\partial \mu^2}{\partial y^2} + \frac{\partial^2 v^2}{\partial x^2} + \frac{\partial^2 v^2}{\partial y^2} \]  
(20)

\[ \frac{\partial T^2}{\partial t^2} + u^2(\frac{\partial T^2}{\partial x^2} + \frac{\partial T^2}{\partial y^2}) = \frac{kmC_p}{Pr} \left( \frac{\partial^2 T^2}{\partial x^2} + \frac{\partial^2 T^2}{\partial y^2} \right) \]  
(21)
Using (13), the boundary and interface conditions (11) and (12) for the velocity and temperature fields become

$$u^{(1)} = v^{(1)} = 0 \quad \text{at} \quad y = -1 + \frac{\varepsilon \cos(\hat{\lambda} x + \theta)}{h}$$
$$u^{(2)} = v^{(2)} = 0 \quad \text{at} \quad y = 1 + \frac{\varepsilon \cos(\hat{\lambda} x)}{h}$$
$$\frac{\partial u^{(1)}}{\partial y} + \frac{\partial v^{(1)}}{\partial x} = \frac{1}{m \sqrt{h}} \left( \frac{\partial u^{(2)}}{\partial y} + \frac{\partial v^{(2)}}{\partial x} \right) \quad \text{at} \quad y = 0$$

$$\frac{\partial p^{(1)}}{\partial x} = \frac{\partial p^{(2)}}{\partial x} \quad \text{at} \quad y = 0$$

$$T^{(1)} = 0 \quad \text{at} \quad y = -1 + \frac{\varepsilon \cos(\hat{\lambda} x + \theta)}, \quad T^{(2)} = 1 \quad \text{at} \quad y = 1 + \frac{\varepsilon \cos(\hat{\lambda} x)}{h}$$

$$T^{(1)} = T^{(2)}, \quad \frac{\partial T^{(1)}}{\partial y} + \frac{\partial T^{(2)}}{\partial x} = k \left( \frac{\partial T^{(2)}}{\partial y} + \frac{\partial T^{(2)}}{\partial x} \right)$$

at $y = 0$ (23)

In the static fluid we have (see Vajravelu and Sastri, 1978)

$$0 = -\frac{\partial p^{(1)}}{\partial x} - \frac{\rho g h^{(13)}}{Pv^{(12)}} + \frac{\partial p^{(2)}}{\partial x} - \frac{\rho g h^{(23)}}{Pv^{(22)}}$$

(24)

In view of (24), Eqs. (15) and (19) becomes

$$\frac{\partial u^{(1)}}{\partial t} + u^{(1)} \frac{\partial u^{(1)}}{\partial x} + v^{(1)} \frac{\partial u^{(1)}}{\partial y} = -\frac{\partial (\rho^{(1)} - p)}{\partial x} + \frac{\partial^2 u^{(1)}}{\partial x^2} + \frac{\partial^2 u^{(1)}}{\partial y^2} + \frac{\partial^2 u^{(1)}}{\partial z^2} + Gr T^{(1)}$$

$$\frac{\partial u^{(2)}}{\partial t} + u^{(2)} \frac{\partial u^{(2)}}{\partial x} + v^{(2)} \frac{\partial u^{(2)}}{\partial y} = -\frac{\partial (\rho^{(2)} - p)}{\partial x} + \frac{\partial^2 u^{(2)}}{\partial x^2} + \frac{\partial^2 u^{(2)}}{\partial y^2} + \frac{\partial^2 u^{(2)}}{\partial z^2} + Gr \beta h^2 m^2 r^2 T^{(2)}$$

(25)

3. Solutions

Eq. (14), (16)–(18), (20), (21), (25), and (26) are coupled nonlinear and are to be solved simultaneously. Due to the non-linearity, analytical solutions are difficult; however approximate solutions can be obtained using perturbation techniques. Assuming that the solutions consist of a mean part and a perturbed part, velocity, pressure and temperature can be written as,

$$u(x, y, t') = u_0(y) + u_1(x, y, t')$$
$$v(x, y, t') = v_1(x, y, t')$$
$$p(x, y, t') = p_0(x, y, t') + p_1(x, y, t')$$
$$T(x, y, t') = T_0(y) + T_1(x, y, t')$$

(27)

(28)

(29)

(30)

where the perturbed quantities $u_1, v_1, p_1$ and $T_1$ are small compared with the mean or zeroth order quantities. The asterisk on $T_1$ and $\hat{\lambda}$ is removed for the sake of simplicity in the following process.

Using (27)–(30) in (14), (16)–(18), (20), (21), (25), and (26) and separating mean and perturbed parts, gives the following equations.

Zeroth order equations

Region-I

$$\frac{d^2 T_0^{(1)}}{dy^2} = 0$$

(31)

$$\frac{d^2 u_0^{(1)}}{dy^2} + Gr T_0^{(1)} = 0$$

(32)

Region-II

$$\frac{d^2 T_0^{(2)}}{dy^2} = 0$$

(33)

$$\frac{d^2 u_0^{(2)}}{dy^2} + Gr \beta h^2 m^2 r^2 T_0^{(2)} = 0$$

(34)

where $\frac{d^2}{dy^2} \left( p_0^{(1)} - p_0^{(2)} \right)$ is taken to be zero (see Ostrach, 1952) for $j = 1, 2$.

First order equations

Region-I

$$\frac{\partial u_1^{(1)}}{\partial x} + \frac{\partial v_1^{(1)}}{\partial y} = 0$$

(35)

$$\frac{\partial u_1^{(1)}}{\partial t} + u_1^{(1)} \frac{\partial u_1^{(1)}}{\partial x} + v_1^{(1)} \frac{\partial u_1^{(1)}}{\partial y} = -\frac{\partial p_1^{(1)}}{\partial x} + \frac{\partial^2 u_1^{(1)}}{\partial x^2} + \frac{\partial^2 u_1^{(1)}}{\partial y^2} + \frac{\partial^2 u_1^{(1)}}{\partial z^2} + Gr T_1^{(1)}$$

(36)

Region-II

$$\frac{\partial u_1^{(2)}}{\partial x} + \frac{\partial v_1^{(2)}}{\partial y} = 0$$

(39)

$$\frac{\partial u_1^{(2)}}{\partial t} + u_1^{(2)} \frac{\partial u_1^{(2)}}{\partial x} + v_1^{(2)} \frac{\partial u_1^{(2)}}{\partial y} = -\frac{\partial p_1^{(2)}}{\partial x} + \frac{\partial^2 u_1^{(2)}}{\partial x^2} + \frac{\partial^2 u_1^{(2)}}{\partial y^2} + \frac{\partial^2 u_1^{(2)}}{\partial z^2} + Gr \beta h^2 m^2 r^2 T_1^{(2)}$$

(40)

$$\frac{\partial v_1^{(1)}}{\partial t} + u_1^{(1)} \frac{\partial v_1^{(1)}}{\partial x} + v_1^{(1)} \frac{\partial v_1^{(1)}}{\partial y} = \frac{k m C_p}{\Pr} \left( \frac{\partial^2 T_1^{(1)}}{\partial x^2} + \frac{\partial^2 T_1^{(1)}}{\partial y^2} \right)$$

(42)

In view of (27)–(30) the boundary and interface conditions (22) and (23) can be split as follows,

Zeroth order boundary and interface conditions for velocity and temperature are

$$u_0^{(1)} = 0 \quad \text{at} \quad y = -1, \quad u_0^{(2)} = 0 \quad \text{at} \quad y = 1,$$

$$u_0^{(1)} = \frac{1}{m \sqrt{h r}}, \quad \frac{d u_0^{(1)}}{dy} = \frac{1}{m \sqrt{h r}} \frac{d u_0^{(2)}}{dy} \quad \text{at} \quad y = 0$$
\[ T_0^{(1)} = 0 \quad \text{at } y = -1, \quad T_0^{(2)} = 1 \quad \text{at } y = 1, \]
\[ T_0^{(1)} = T_0^{(2)}, \quad \frac{dT_0^{(1)}}{dy} = k \frac{dT_0^{(2)}}{dy} \quad \text{at } y = 0 \]  
(44)

First order boundary and interface conditions for velocity and temperature are
\[ u_1^{(1)} = -\cos(\lambda x + \theta) \frac{du_1^{(1)}}{dy}, \quad v_1^{(1)} = 0 \quad \text{at } y = -1, \]
\[ u_1^{(2)} = -\frac{\cos(\lambda x)}{h} \frac{du_1^{(2)}}{dy}, \quad v_1^{(2)} = 0 \quad \text{at } y = 1 \]
\[ u_1^{(1)} = \frac{1}{mhr} u_1^{(2)}, \quad v_1^{(1)} = \frac{1}{mhr} v_1^{(2)} \quad \text{at } y = 0, \]
\[ \frac{\partial u_1^{(1)}}{\partial y} + \frac{\partial v_1^{(1)}}{\partial x} = \frac{1}{m^2 h r} \left( \frac{\partial u_1^{(2)}}{\partial y} + \frac{\partial v_1^{(2)}}{\partial x} \right) \quad \text{at } y = 0 \]
\[ \frac{\partial p_1^{(1)}}{\partial x} = \frac{1}{m^2 h r} \frac{\partial p_1^{(2)}}{\partial x} \quad \text{at } y = 0 \]  
(45)

\[ T_1^{(1)} = -\cos(\lambda x + \theta) \frac{dT_1^{(1)}}{dy} \quad \text{at } y = -1, \]
\[ T_1^{(2)} = -\frac{\cos(\lambda x)}{h} \frac{dT_1^{(2)}}{dy} \quad \text{at } y = 1 \]
\[ T_1^{(1)} = T_1^{(2)}, \quad \frac{\partial T_1^{(1)}}{\partial y} + \frac{\partial T_1^{(2)}}{\partial x} = k \left( \frac{\partial T_1^{(2)}}{\partial y} + \frac{\partial T_1^{(1)}}{\partial x} \right) \quad \text{at } y = 0 \]  
(46)

In order to solve (35)–(42), for the first order quantities it is convenient to introduce stream function \( \psi \) in the following form
\[ u_1^{(j)} = -\frac{\partial \psi^{(j)}}{\partial y} \quad \text{and} \quad v_1^{(j)} = \frac{\partial \psi^{(j)}}{\partial x} \quad \text{for } j = 1, 2 \]  
(47)

The stream function approach reduces the number of dependent variables to be solved and also eliminates pressure from the list of variables. Differentiate (36) with respect to \( y \) and differentiate (37) with respect to \( x \) and then subtract (36) with (37) which will result in the elimination of pressure \( p_1^{(2)} \). Similar procedure is opted for the elimination of pressure \( p_0^{(1)} \) from (40) and (41). Eqs. (35)–(42) after the elimination of \( p_1^{(1)} \) and \( p_1^{(2)} \), can be expressed in terms of stream function \( \psi \) in the form

region-I
\[ \psi_{xxy}^{(1)} + \psi_{yy}^{(1)} + u_0^{(1)} \psi_{xxy}^{(1)} - \psi_{x}^{(1)} u_0^{(1)} + u_0^{(1)} \psi_{xxx}^{(1)} - \psi_{xxx}^{(1)} \]
\[ - \psi_{yy}^{(1)} + 2 \psi_{xyy}^{(1)} + Gr T_1^{(1)} = \psi_{xxx}^{(1)} \]  
(48)
\[ T_1^{(1)} + u_0^{(1)} T_1^{(1)} + \psi_1^{(1)} T_0^{(1)} = \frac{1}{Pr} \left( T_1^{(1)} + T_1^{(1)} \right) \]  
(49)

region-II
\[ \psi_{xxy}^{(2)} + \psi_{yy}^{(2)} + u_0^{(2)} \psi_{xxy}^{(2)} - \psi_0^{(2)} u_0^{(2)} + u_0^{(2)} \psi_{xxx}^{(2)} - \psi_{xxx}^{(2)} \]
\[ - \psi_{yy}^{(2)} + 2 \psi_{xyy}^{(2)} + Gr \beta h^3 m^2 r^2 T_1^{(2)} = 0 \]  
(50)
\[ T_1^{(2)} + u_0^{(2)} T_1^{(1)} + \psi_1^{(2)} T_0^{(1)} = \frac{kmC}{Pr} \left( T_1^{(2)} + T_1^{(2)} \right) \]  
(51)

where a suffix \( x \) or \( y \) represents derivative with respect to \( x \) or \( y \).

The corresponding boundary and interface conditions on velocity and temperature reduces to
\[ \psi_{x}^{(1)} = \cos(\lambda x + \theta) u_0^{(1)}, \quad \psi_{x}^{(2)} = \cos(\lambda x) u_0^{(2)}, \quad \psi_{x}^{(1)} = \psi_{x}^{(2)} = 0 \quad \text{at } y = -1, \]
\[ \psi_{y}^{(2)} = \frac{\psi_{y}^{(2)}}{mhr}, \quad \psi_{y}^{(2)} - \psi_{y}^{(2)} = \frac{\psi_{y}^{(2)} - \psi_{y}^{(2)}}{m h^3 r} \quad \text{at } y = 0 \]
\[ \psi_{xy}^{(1)} = \psi_{xy}^{(2)} + u_0^{(1)} \psi_{xy}^{(1)} - \psi_{xy}^{(2)} - \psi_{xy}^{(2)} + Gr T_1^{(1)} \]
\[ = \frac{1}{m h^3 r} \left( \psi_{y}^{(2)} - \psi_{y}^{(2)} u_0^{(2)} + u_0^{(2)} \psi_{xy}^{(2)} - \psi_{xy}^{(2)} - \psi_{xy}^{(2)} + Gr \beta h^3 m^2 r^2 T_1^{(2)} \right) \quad \text{at } y = 0 \]  
(52)
\[ T_1^{(1)} = -\cos(\lambda x + \theta) T_0^{(1)} \quad \text{at } y = -1, \]
\[ T_1^{(2)} = -\frac{\cos(\lambda x)}{h} T_0^{(2)} \quad \text{at } y = 1 \]
\[ T_1^{(2)} = T_1^{(2)} + T_1^{(2)} = \frac{k(T_1^{(2)} + T_1^{(2)})}{h} \quad \text{at } y = 0 \]  
(53)

We assume stream function and temperature in the following form
\[ \psi^{(1)} = e^{i(\lambda x + \alpha)} \psi^{(1)}(y), \quad T_1^{(2)} = e^{i(\lambda x + \alpha)} T^{(2)}(y) \quad \text{for } j = 1, 2 \]  
(54)

from which we infer
\[ u_1(x, y, t) = e^{i(\lambda x + \alpha)} u_1(y), \quad v_1(x, y, t) = e^{i(\lambda x + \alpha)} v_1(y) \]  
(55)

where \( i \) is the imaginary unit.

In view of (54), (48)–(51) becomes

Region-I
\[ \psi_{xxy}^{(1)} = \left[ i \alpha + i \lambda u_0^{(1)} + 2 \beta \right] \psi_{xx}^{(1)} + \left[ i \alpha \lambda^2 + i \lambda^2 u_0^{(1)} + \lambda^2 \psi_{xxy}^{(1)} - \psi_{xyy}^{(1)} - Gr \beta h^3 m^2 r^2 T_1^{(1)} = 0 \]  
(56)
\[ i \alpha \left( \psi_{xxy}^{(1)} + \lambda u_0^{(1)} \psi_{xxy}^{(1)} + \lambda T_0^{(1)} \psi_{xxy}^{(1)} = \frac{1}{Pr} \left( -\lambda^2 \psi_{xxy}^{(1)} + \psi_{xx}^{(1)} \right) \right) \]  
(57)

Region-II
\[ \psi_{xxy}^{(2)} = \left[ i \alpha + i \lambda u_0^{(2)} + 2 \beta \right] \psi_{xx}^{(2)} + \left[ i \alpha \lambda^2 + i \lambda^2 u_0^{(2)} + \lambda^2 \psi_{xxy}^{(2)} - \psi_{xyy}^{(2)} - Gr \beta h^3 m^2 r^2 T_1^{(2)} = 0 \]  
(58)
\[ i \alpha \left( \psi_{xxy}^{(2)} + \lambda u_0^{(2)} \psi_{xxy}^{(2)} + \lambda T_0^{(1)} \psi_{xxy}^{(2)} \right) = \frac{kmC}{Pr} \left( -\lambda^2 \psi_{xxy}^{(2)} + \psi_{xx}^{(2)} \right) \]  
(59)

Boundary and interface conditions (52) and (53) can be written in terms of \( \psi^{(1)} \) and \( \psi^{(2)} \) as
\[ \frac{\partial \psi^{(1)}}{\partial y} = \cos(\omega t) \frac{d u_0^{(1)}}{d y}, \quad \psi^{(1)} = 0 \quad \text{at } y = -1, \]
\[ \frac{\partial \psi^{(2)}}{\partial y} = \frac{\cos(\omega t)}{h} \frac{d u_0^{(2)}}{d y}, \quad \psi^{(2)} = 0 \quad \text{at } y = 1 \]
Mixed convective flow of immiscible fluids in a vertical corrugated channel with traveling thermal waves

\[
\psi^{(2)} = \frac{\psi_{10}^{(1)}}{m \nu h} \psi^{(1)} = \frac{\psi_{20}^{(2)}}{m \nu h} \psi^{(1)} + \frac{\psi_{10}^{(2)}}{m \nu h} \psi^{(2)} - \frac{\psi_{10}^{(2)}}{m \nu h} \psi^{(2)} = \frac{\psi_{1y}^{(2)}}{m \nu h} \psi^{(2)} \quad \text{at } y = 0
\]

\[
i \delta \psi^{(1)} = \left( i \delta \nu \psi^{(1)} + i \delta \mu \right) \psi^{(1)} = \psi^{(2)} + \frac{\psi^{(2)}}{m \nu h} \psi^{(2)} - \frac{\psi^{(2)}}{m \nu h} \psi^{(2)}
\]

\[
= \frac{1}{m \nu h} \left( i \delta \psi^{(2)} \psi^{(2)} - \left( i \delta \psi^{(2)} + i \delta \mu \right) \psi^{(2)} + \frac{\psi^{(2)}}{m \nu h} \psi^{(2)} - \frac{\psi^{(2)}}{m \nu h} \psi^{(2)} \right)
\]

\[
= Gr \beta \nu h \cdot \psi^{(2)} \quad \text{at } y = 0
\]

\[
\phi^{(1)} = -\cos(\cot - \theta) \frac{dT_0^{(1)}}{dy} \quad \text{at } y = -1,
\]

\[
\phi^{(2)} = -\cos(\cot - \theta) \frac{dT_0^{(2)}}{dy} \quad \text{at } y = 1
\]

\[
\phi^{(1)} = \phi^{(2)}, \quad \phi_y^{(1)} + i \delta \phi_y^{(1)} = \frac{\mu}{\nu} \left( \phi^{(2)} + i \delta \phi^{(2)} \right) \quad \text{at } y = 0
\]

We restrict our attention to the real parts of the solutions for the perturbed quantities \( \psi, \phi, \psi_1 \) and \( \psi_2 \).

Consider only small values of \( \lambda \) on substituting

\[
\psi(\lambda, y) = \sum_{n=0}^{\infty} \lambda^n \psi_n, \quad \phi(\lambda, y) = \sum_{n=0}^{\infty} \lambda^n \phi_n
\]

into (56)–(60) we obtain the following set of ordinary differential equations

Zeroth order equations

\[
\frac{d \psi_{10}}{dy} = \frac{d \psi_{20}}{dy} = 0
\]

First order equations

\[
\frac{d \psi_{01}}{dy} - i \delta \psi_{01} = i \delta \psi_{01} - \frac{d T_{01}}{dy} \psi_{01}
\]

\[
\frac{d \psi_{11}}{dy} - i \delta \psi_{11} = i \delta \psi_{11} - \frac{d T_{11}}{dy} \psi_{11}
\]

\[
\frac{d \psi_{21}}{dy} - i \delta \psi_{21} = i \delta \psi_{21} - \frac{d T_{21}}{dy} \psi_{21}
\]

Zeroth order boundary and interface conditions in terms of stream function and temperature are

\[
\frac{d \psi_{10}}{dy} = \cos(\cot - \theta) \frac{d \psi_{10}}{dy}, \quad \psi_{10} = 0 \quad \text{at } y = -1
\]

\[
\psi_{10} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \cos(\cot - \theta) \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

\[
\frac{d \psi_{20}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{20}}{dy}, \quad \psi_{20} = 0 \quad \text{at } y = 1
\]

The first order boundary and interface conditions in terms of stream function and temperature are

\[
\frac{d \psi_{11}}{dy} = 0, \quad \psi_{11} = 0 \quad \text{at } y = -1, \quad \psi_{21} = 0 \quad \text{at } y = 1
\]

\[
\psi_{11} = \frac{\psi_{21}}{m \nu h}, \quad \frac{d \psi_{11}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{21}}{dy}, \quad \frac{d \psi_{11}}{dy} = \frac{1}{m \nu h} \frac{d \psi_{21}}{dy}
\]

\[
\frac{d \psi_{21}}{dy} = \frac{1}{m \nu h} \left( i \frac{d \psi_{21}}{dy} - \frac{d \psi_{21}}{dy} \psi_{21} \right) - i \delta \psi_{21} - Gr \beta \psi_{21}
\]

\[
\phi_{10} = -\cos(\cot - \theta) \frac{d T_{10}}{dy} \quad \text{at } y = -1,
\]

\[
\phi_{20} = -\cos(\cot - \theta) \frac{d T_{20}}{dy} \quad \text{at } y = 1
\]

\[
\phi_{10} = \phi_{20}, \quad \frac{d \phi_{10}}{dy} = \frac{k d \phi_{20}}{dy} \quad \text{at } y = 0
\]

The set of Eqs. (31)–(34) subjected to boundary and interface conditions (43) and (44) have been solved exactly for \( \psi_{01} \) and \( T_{01} \), and the set of Eqs. (63) and (64) subject to boundary and interface conditions (65) and (66) have been solved exactly for \( \psi_{11} \) and \( \psi_{21} \). The solutions are given in the appendix section. From these solutions, the first order quantities can be put in the form,

\[
\psi_j = (\psi_j + i \psi_j) = \psi_j + i \psi_j, \quad \phi_j = (\phi_j + i \phi_j)
\]

\[
= \phi_j + i \phi_j \quad (j = 1, 2)
\]

Suffix \( r \) denotes the real part and \( i \) denotes the imaginary part

Considering only the real part, the expression for first order velocity and temperature become
\[ u_1^{(0)}(x, y, t) = \varepsilon \left( -\cos(\lambda x + \omega t) \frac{d\psi_2}{dy} + \lambda \sin(\lambda x + \omega t) \frac{d\psi_1}{dy} \right) \]

\[ v_1^{(0)}(x, y, t) = \varepsilon \left( -\lambda \psi_1 \sin(\lambda x + \omega t) - \lambda^2 \psi_1 \cos(\lambda x + \omega t) \right) \]

\[ T_1^{(0)}(x, y, t) = \varepsilon (\cos(\lambda x + \omega t) \phi_{y_1} - \lambda \sin(\lambda x + \omega t) \phi_{y_2}) \]

The total solutions for the velocity and temperature become the summation of the mean and perturbed parts.

3.1. Skin friction and Nusselt number

The shearing stress \( \tau_{xy} \) at any point in the fluid is given in non-dimensional form by

\[ \tau_{xy} = \left( \frac{h^{(0)^2}}{\mu^{(0)^2}} \right) \tau_{xy} = \frac{\partial u^{(0)}}{\partial y} + \frac{\partial v^{(0)}}{\partial x} \]

At the wavy walls \( y = -1 + \cos(\lambda x + \theta) \) and \( y = 1 + \frac{\cos(\lambda x + \theta)}{\pi} \), the skin friction \( \tau_{xy} \) becomes

\[ \tau_{-1} = \tau_{0(1)} + \varepsilon Re \left( \frac{1}{h} \varepsilon^{(0)} \left( \frac{d^2 u_{0}^{(0)}}{d y^2} + \frac{d u_{0}^{(0)}}{d y} \right)(-1) + \frac{d u_{1}^{(0)}}{d y}(-1) \right) \]

and

\[ \tau_{1} = \tau_{0(1)} + \varepsilon Re \left( \frac{1}{h} \varepsilon^{(0)} \left( \frac{d^2 u_{0}^{(0)}}{d y^2} + \frac{d u_{0}^{(0)}}{d y} \right)(1) + \frac{d u_{1}^{(0)}}{d y} \right) \]

respectively, where \( \tau_{0(1)} = \left( \frac{d u_{0}^{(0)}}{d y} \right)_{y=-1} \) and \( \tau_{0(1)} = \left( \frac{d u_{0}^{(0)}}{d y} \right)_{y=1} \)

The dimensionless Nusselt number is given by

\[ d = -\frac{K^{(0)}(\tilde{T}_2 - \tilde{T}_1)}{h^{(0)}} \left( \frac{d T_0^{(0)}}{d y} + Re \left( \varepsilon^{(0)} \frac{d^2 u_{0}^{(0)}}{d y^2} \phi_{y_1}^{(0)}(y) \right) \right) \]

or

\[ Nu = \frac{d h^{(0)}}{K^{(0)}(\tilde{T}_2 - \tilde{T}_1)} \frac{d T_0^{(0)}}{d y} + Re \left( \frac{d T_0^{(0)}}{d y} \right) \phi_{y_1}^{(0)}(y) \]

At the wavy walls \( y = -1 + \frac{\cos(\lambda x + \theta)}{\pi} \) and \( y = 1 + \frac{\cos(\lambda x + \theta)}{\pi} \), Eq. (74) assumes the form

\[ Nu_{-1} = Nu_{0(1)}^{(0)} + \varepsilon Re \left( \varepsilon^{(0)} \frac{d^2 T_0^{(0)}}{d y^2} \left(-1 \right) + \frac{d T_0^{(0)}}{d y} \left(-1 \right) \right) \]

and

\[ Nu_{1} = Nu_{0(1)}^{(0)} + \varepsilon Re \left( \varepsilon^{(0)} \frac{d^2 T_0^{(0)}}{d y^2} \left(1 \right) + \frac{d T_0^{(0)}}{d y} \right) \]

respectively, where \( Nu_{0(1)} = \left( \frac{d u_{0}^{(0)}}{d y} \right)_{y=-1} \) and \( Nu_{0(1)} = \left( \frac{d u_{0}^{(0)}}{d y} \right)_{y=1} \)

where Re represents the real part.

Velocity and temperature solutions are numerically evaluated for several sets of values of the parameters such as, Grashof number \( Gr \), viscosity ratio \( m \), width ratio \( h \), conductivity ratio \( k \), frequency parameter \( \omega \) and traveling thermal temperature \( \theta \). Also, the wall skin friction \( \tau_{-1}, \tau_{1} \) and the wall Nusselt number \( Nu_{-1}, Nu_{1} \) are calculated numerically and some of the qualitative interesting features are presented graphically.

4. Results and discussion

Analytical solution for the unsteady mixed convection of two immiscible viscous fluids in a vertical wavy channel is analyzed. The non-linear equations are solved by a linearization technique wherein the flow is assumed to be in two parts; a mean part and a perturbed part. Exact solutions are obtained for the mean part and the perturbed part is solved using the long wave approximation. The continuity of velocity, pressure gradient along the flow direction, temperature, shear stress and heat flux across the interface are assumed. The solutions of zeroth order velocity \( u_0 \) and the zeroth order temperature \( T_0 \) are applicable to the case of a channel both of whose walls are flat. The solutions for mean part \( (u_0, T_0) \) and perturbed part \( (u_1, r_1, T_1) \) are evaluated numerically and represented graphically for various governing parameters in Figs. 2–14. In all the graphs density ratio, the ratio of thermal expansion coefficient, ratio of specific heat at constant pressure, Prandtl number, wave number, amplitude parameter, \( \omega \) and \( k \) are fixed as 1, 1, 1, 0.7, 0.02, 0.02, \( \pi/4, \pi/2 \) respectively for all the computations, whereas the Grashof number, viscosity ratio, width ratio, conductivity ratio, frequency parameter and traveling thermal temperature \( \theta \) are fixed as 5, 1, 1, 1, 10, 0 respectively for all the graphs except the varying the parameters which are shown in Figs. 2–14.

The behavior of the non-dimensional velocity with changes in the Grashof number \( Gr \) is shown in Fig. 2. The effect of the Grashof number on zeroth order velocity \( u_0 \) is to increase the velocity in both the regions. The effect of the Grashof number on the first order velocity \( u_1 \) is to increase the velocity in region-I \((-1 \leq y \leq 0.2 \text{ approximately})\) and then decreases in region-II \(0.2 \leq y \leq 1 \text{ as seen in Fig. 2b. The behavior of total fluid velocity \( u \) is same as that of zeroth order velocity as seen in Fig. 2c. Physically, an increase in the value of the Grashof number means an increase in the buoyancy force which supports the motion. Fig. 2d depicts the effect of velocity \( v \) perpendicular to the channel length on the Grashof number and it is noticed that the velocity \( v \) diminishes sharply as the Grashof number increases.\]

Fig. 3 shows the effect of viscosity ratio \( m = \mu^{(1)}/\mu^{(0)} \) on the velocity. As the viscosity ratio increases the zeroth order velocity increases in both the regions, whereas its effect is more dominant in the region-II when compared to region-I as seen in Fig. 3a for values of \( m \geq 1 \). Fig. 3b depicts the variations of viscosity ratio \( m \) on the first order velocity. As the viscosity ratio increases, first order velocity \( u_1 \) increases from \( y = -1 \) to \( y = 0.4 \) (approximately) and it decreases from \( y = 0.4 \) to 1 and its effect is more dominant near the right wavy wall. The effect of viscosity ratio on total fluid velocity \( u \) shows the similar nature as that for zeroth order velocity as seen in Fig. 3c. Physically, as \( m \) increases, the fluid becomes more viscous in region-I and hence velocity is reduced in region-I when compared to region-II. Hence the velocity is more operative in region-II for variations of viscosity ratio. Fig. 3d shows the behavior of the fluid velocity \( v \) perpendicular to the channel length. It is noticed that as the viscosity ratio increases, \( v \) decreases in both the regions and the effect of viscosity ratio are more effective in region-II compared to region-I.

The viscosity ratio \( m = \mu^{(1)}/\mu^{(0)} \) does not affect the zeroth order temperature profiles as seen in Fig. 4a. From Fig. 4b it is seen that the first order temperature \( T_1 \) increases as the
viscosity ratio increases to the order of $10^{-3}$. The effect of viscosity ratio on the total temperature $T$ is almost identical to that of zeroth order temperature as seen in Fig. 4c.

The effect of width ratio parameter $h(=h^{(2)}/h^{(1)})$ on velocity is similar to the effect of viscosity ratio as shown in Fig. 5. As the width ratio $h$ increases zeroth order velocity
increases in both the regions, however its effect is more dominant in the region-II compared to region-I as seen in Fig. 5a. The effect of width ratio $h$ on first order velocity $u_1$ (Fig. 5b) shows that as $h$ increases, $u_1$ increases from $y = -1$ to $y = 0.4$ approximately while for values of $0.4 < y < 1$ the fluid velocity $u_1$ decreases, and the effect of width ratio is more effective on the right wavy wall as seen in Fig. 5b. It is observed from Fig. 5c that the total fluid velocity $u$ is sim-
ilar to that on the zeroth order velocity $u_0$. The effect of width ratio on velocity $v$ decreases as the width ratio $h$ increases as seen in Fig. 5d.

The effect of width ratio $h$ on the zeroth order temperature is to decrease the temperature in both regions as seen in Fig. 6a. The first order temperature decreases to the order $-1.0 -0.8 -0.6 -0.4 -0.2 0.0 0.2 0.4 0.6 0.8 1.0$.

Figure 6  Temperature profiles for different values of width ratio. (a) zeroth order, (b) first order and (c) total temperature.

Figure 7  Velocity profiles for different values of conductivity ratio. (a) zeroth order, (b) first order, (c) total velocity in $u$ and (d) total velocity in $v$. 
of $10^{-3}$ in both regions as width ratio $h$ increases as seen in Fig. 6b. The effect of width ratio $h$ on the total temperature $T$ is similar to zeroth order temperature as seen in Fig. 6c.

The effect of conductivity ratio $k(=k^{(2)}/k^{(1)})$ on the velocity is similar to the effect of Grashof number as seen in Fig. 7. Fig. 7a shows that as the conductivity ratio $k$ increases the
zeroth order velocity increase in both the regions. The first order velocity $u_1$ increases as the conductivity ratio $k$ increases in region-I and decreases in region-II as seen in Fig. 7b. The effect of conductivity ratio $k$ on the total velocity $u$ is similar to the
zeroth order velocity $u_0$ as seen in Fig. 7c. The behavior of the fluid velocity $v$ perpendicular to the channel length decreases as conductivity ratio $k$ increases as seen in Fig. 7d.

The effect of the conductivity ratio $k$ on zeroth order temperature $T_0$ is to increase the temperature in both the regions as seen in Fig. 8a. The first order temperature $T_1$ increases as the conductivity ratio $k$ increases in region-I (i.e. from $y = -1$ to $y = 0.5$ approximately) and decreases from $y = 0.5$ to 1 as seen in Fig. 8b. Here also the effect of conductivity ratio $k$ on total temperature $T$ is similar to the effect on zeroth order temperature.

The effect of the frequency parameter $\omega$ on the zeroth order velocity $u_0$ is invariant as seen in Fig. 9a. The effect of frequency parameter on first order velocity $u_1$ decreases in region-I ($-1 \leq y \leq 0$ approximately) and increases in region-II ($0 \leq y \leq 1$ approximately) as seen in Fig. 9b. There is no effect of the frequency parameter on total velocity $u$ as seen in Fig. 9c. Fig. 9d shows the variations of velocity $v$ perpendicular to the channel length. The velocity $v$ increases as the frequency parameter $\omega$ increases to the order of $10^{-4}$.

The effect of frequency parameter $\omega$ is invariant on zeroth order temperature as seen in Fig. 10a. As the frequency parameter $\omega$ increases, the first order temperature decreases in both the regions as seen in Fig. 10b. Here also the effect of frequency parameter $\omega$ is invariant on the total temperature as seen in Fig. 10c.

The variations of traveling thermal temperature $\theta$ on zeroth order velocity is invariant as seen in Fig. 11a. The first order velocity $u_1$ decreases near the left wall ($-1 \leq y \leq -0.4$ approximately) and increases from $y = -0.4$ to 1 (approximately) as

![Figure 12](image12.png)  
**Figure 12** Temperature profiles for different values of traveling thermal temperature $\theta$. (a) zeroth order (b) first order and (c) total temperature.

![Figure 13](image13.png)  
**Figure 13** Nusselt number profiles.
traveling thermal temperature $\theta$ increases as seen in Fig. 11b. The values for first order velocity $u_1$ remain the same for $\theta = 0, \pi/2$ and $\pi, 3\pi/2$. As the traveling thermal temperature $\theta$ increases, total velocity $u$ decreases slightly near the left wall and the effect of traveling thermal temperature is invariant from $y = -0.5$ to 1 as seen in Fig. 11c. Fig. 11d shows the variations of velocity $v$ perpendicular to the channel length. The velocity $v$ increases as traveling thermal temperature $\theta$ increases to the order of $10^{-4}$. The values for velocity $v$ remain the same for $\theta = 0, \pi/2$ and $\pi, 3\pi/2$.

The variations of traveling thermal temperature $\theta$ on zeroth order temperature is invariant as seen in Fig. 12a. Fig. 12b shows the variations of first order temperature. The first order temperature decreases as traveling thermal temperature $\theta$ increases to the order of $10^{-2}$. Here also the values of $\theta = \pi/2$ and $\pi, 3\pi/2$ remain the same as seen in Fig. 12b. There is no effect of traveling thermal temperature $\theta$ on total temperature as seen in Fig. 12c.

The Nusselt number $Nu$ is shown in Fig. 13. It is observed that the effect of Grashof number $Gr$ is invariant on Nusselt number. The Nusselt number at the left wavy wall $Nu_{L-1}$ is invariant and Nusselt number at the right wavy wall $Nu_{R}$ decreases as viscosity ratio $m$ increases. As the width ratio $h$ increases the Nusselt number at the left wall decreases and increases at the right wall. The Nusselt number increases at the left wall and decreases at the right wall as the conductivity ratio $k$ increases.

Fig. 14 shows the behavior of skin friction $\tau$ at the channel walls. The effect of increase in Grashof number is to increase the skin friction at the left wall and decreases at the right wall. The effect of viscosity ratio $m$, width ratio $h$ and conductivity ratio $k$ increases, skin friction increases at the left wall, whereas it decreases at the right wall.

Table 1 shows the variations of temperature on Grashof number. The effect of Grashof number is invariant on zeroth order temperature. As the Grashof number increases first order temperature and total temperature increases to the order of $10^{-4}$ as seen Table 1.

### 5. Conclusions

The Grashof number, viscosity ratio, width ratio, and conductivity ratio enhance the velocity parallel to the flow direction and reversal effect is observed on the fluid velocity perpendicular to the channel length. The frequency parameter and traveling thermal temperature is invariant on the velocity parallel to the flow direction and promotes the velocity perpendicular to the flow direction. The Grashof number and viscosity ratio are not operative on the temperature whereas width ratio reduces the temperature and conductivity ratio increases the temperature field. The Nusselt number remains invariant on Grashof number and viscosity ratio whereas the Nusselt number decreases at the left wall and increases at the right wall as width ratio increases and conductivity ratio decreases. The Grashof number, viscosity ratio, width ratio and conductivity ratio promote the skin friction at the left wall and suppresses at the right wall.
