OBJECTIVES: POLARIS is a 26-week, double-blind, randomised study comparing the efficacy of rosuvastatin (RSV) 40mg with atorvastatin (ATV) 80mg in high-risk patients (known CHD or CHD-risk equivalent, as defined by NCEP ATP III) with hypercholesterolaemia. Using a secondary prevention model, results from POLARIS were used to estimate longer-term costs and benefits. METHODS: Efficacy data from POLARIS (TC, HDL-C, and TGs) were used as input to the model. Markov models were run in 4-year cycles over 20 years, from age 55 to 76 years for men and women separately. Secondary CHD risk was based on Framingham data (d’Agostino et al. AHJ 2000) but calibrated to British Regional Heart Study (Brindle et al. BMJ 2003). Estimates for life expectancy, health-care costs and quality-adjusted life years (QALYs) were assigned to patients as they transitioned through the model. RESULTS: RSV 40mg improved levels of TC and HDL-C more than ATV 80mg (~41% vs. ~39%; +11.0 vs. +6.2%, respectively). The model predicts that more secondary CHD events and deaths are avoided with RSV 40mg compared with ATV 80mg in both high-risk men and women; hence, more life-years and QALYs are generated and event costs are lower. More patients survive on treatment and therefore total costs with RSV 40mg are slightly higher. Cost per life year gained (men: £1113, women: £1065) and QALY gained (men: £2091, women: £3079) are favourable for RSV 40mg. CONCLUSIONS: RSV 40mg is likely to be more effective both clinically and economically than ATV 80mg for the secondary prevention of CHD.

While treatment guidelines recommend lowering cholesterol to target levels, many remain above goal (LDL-C >100mg/dl for CHD/diabetic patients and LDL-C >130mg/dl for other non-CHD high-risk individuals). OBJECTIVE: To assess the change in LDL-C and goal attainment rates due to switching patients to an Ezetimibe/Simvastatin dose titration strategy, compared with a simulated statin monotherapy dose titration strategy. METHOD: A decision-analytic model was developed to project goal attainment at end of 1-year after therapy change. Clinical trial data were used to estimate LDL-C reductions for different treatment strategies. The model was run for a population of 504 Spanish patients (237 CHD/diabetic and 267 non-CHD high risk patients) that had not reached LDL-C goal levels 3-months after starting statin therapy. Patients not at goal where up titrated (till goal attainment or to the maximum dose whichever was first) every 3 months both in the Ezetimibe/Simvastatin (only simvastatin titrated) and in the statin monotherapy titration arms. RESULTS: Mean age was 60.8 (SD 9.8) years, 47.8% female, lipid profile (mg/dl) at three months on statin monotherapy was LDL-C 182.3 (SD 35.1), TC 262.1 (SD 39.5), HDL-C 50.8 (SD 14.1), triglycerides 150.1 (SD 82.5). Ezetimibe/Simvastatin therapy is projected to achieve a 82.6% goal attainment rate, compared with 46.0% projected for the statin titration strategy. With respect to LDL-C reductions, Ezetimibe/Simvastatin would achieve a 38.2% reduction over baseline, compared with a 24.5% with the statin titration strategy. In the statin arm, 73.9% of the patients reached the statin maximum dose, whereas in the Ezetimibe/Simvastatin arm, only 23.5% of the patients did so. CONCLUSION: Compared to statin monotherapy titration, switching patients not at goal on statin monotherapy to Ezetimibe/Simvastatin followed by titration is projected to get 36.6% additional patients to goal and reduce LDL-c by 13.7%.

BELGIAN EVALUATION OF SCREENING AND TREATMENT OF HIGH RISK PATIENTS BASED ON WAIST AND AGE (BEST) DE BACKER G1, BROHET C2, SHEEN AJ2, VAN GAAL L1, VANDENHOVEN G1, VISSERS E5, SCHOckaert B3
1Ghent University, Ghent, BC, Belgium; 2University of st-Luc, Brussels, Belgium; 3University of Liege, Liege, Belgium; 4University Hospital Antwerpen, Antwerpen, Belgium; 5Astrazeneca, Brussels, Belgium

OBJECTIVE: The objective of this study was to describe the burden of modifiable risk factors and of the total CV risk in a population, free of CVD, selected in general practice, on the basis of age (40–75yrs) and waist circumference (>=94cm in men and >80cm in women). METHODS: In total, 619 Belgian GPs recruited consecutive patients during spring 2004. A central lab analysed fasting blood samples. RESULTS: Complete data on 8587 patients were obtained. Mean age was 58yrs (47% women). Mean BMI and waist were 30.1kg/m2 and 99cm for women and 30.1kg/m2 and 107cm for men. Eighty-percent had diabetes (D) either known and treated (14%) or newly detected, based on fasting glucose levels (4%). Of the non-diabetic subjects (ND), 25% had ‘Y3 metabolic syndrome risk factors (NCEP-ATP III criteria). Twenty-four percent of the total population was smoking and 84% did not engage in regular physical activity. Seventy-seven percent of ND had LDL cholesterol >115mg/dl & 78% of D had LDL cholesterol >100mg/dl. Only 31% of subjects on lipid lowering drugs had TC <190 and LDL <115mg/dl. 49% of ND had BP >140/90 mmHg and 91% of the D had BP >130/80 mmHg. Total CV risk in the ND was estimated using the SCORE chart calibrated for Belgium. Total risk >=5% for dying from CVD in the coming 10yrs was present in more than 40% of men and in more than 20% of women. CONCLUSION: Waist measurement is an easy and inexpensive tool to detect, in the middle-aged population free of CVD, a subgroup with a large variety of modifiable risk factors and at high risk for CV death. A large majority of them is physically inactive, an unacceptable proportion is smoking and both total cholesterol and blood pressure are insufficiently managed.

A MULTILEVEL ANALYSIS ON PRESCRIBED STATINES IN A BOLOGNA HEALTH AUTHORITY FROM 2000 TO 2003
ROLI G1, CAVRINI G1, PANDOLFI P2
1University of Bologna, Bologna, Italy; 2Health Authority of Bologna, Bologna, Italy

OBJECTIVES: The main aim is to evaluate the variability of practitioners’ prescribing behaviour on statines in AUSL Bologna South from 2000 to 2003, as well as to quantify how much such a behaviour depends on culture, education and policy of practitioner. METHODS: A multilevel model has been built to reflect...
