Conclusions: Serial IVUS analyses suggest that PKB may improve stent apposition without impact on stent expansion and neointimal hyperplasia in bifurcation lesions treated with 1-stent technique.

Background: The Sideguard® (Cappella) stent is a self-expanding nitinol stent specifically designed with a flaring cap for treatment of bifurcation lesions. Aim of this registry study is to assess the safety and clinical efficacy of this novel stent in treating bifurcation lesions in a real world setting.

Methods: Since June 2010 a dedicated CFR registries has been used to collect data on all patients undergoing PCI with the Sideguard stent in the 36 participating European centres. Data collected include Patient demographics, PCI procedure and clinical follow-up up to 1 yr. Clinical end point studied includes death, myocardial infarction (MI) and target lesion revascularisation (TLR). Secondary endpoints included procedure time, fluoroscopy time, contrast volume, procedural success and device success. The study is on-going and to date complete data up to discharge is available in 320 patients and is reported here.

Results: Mean age was 65±10.6 and 247(77%) were male and 18% were diabetic. Bifurcation site was in LAD in 71%, CX in 18%, RCA in 3% and Left Main in 8%. Medina classification was 1:1:1 in 69%, 1:0:1 in 8%, 0:1:1 in 15%. Calculication was present in 28% of the cases. Mean main vessel diameter was 3.33±0.44mm, mean vessel stent length was 22.3±7.05mm Mean side branch (SB) vessel diameter was 2.75±0.30mm and mean SB vessel lesion length was 8.9±5.9 In 12% cases a second DES stent was used in the SB distal to Sideguard stent. Final kissing balloon was attempted in 52% cases and was successful in all cases. TIMI flow pre-procedure was TIMI 3 in 80% of cases and 99% post-procedure. From the entire cohort there was a 10.6% procedural failure and a 3.7% device failure defined by the protocol. MACE was 3.1% of 320, 6.7% of 254 & 11.2% of 107 patients at 30 days, 6 and 12 months respectively. Total stent thrombosis rate was 1.2%.

Conclusions: In this on-going registry study, the data to date shows that Sideguard® stent can be used to treat complex bifurcation lesions successfully with a very low procedural complication. Follow up clinical outcome also remains favorable though more data is required which should be available at the time of presentation.

The Feasibility And Safety Of Balloon Dilation Over The Jailed Wire To Reopen The (sub)Occluded Side Branch During Provisional Stenting
li chengxiang1, xuan ming2
1sijing hospital, X'ian, Shaan'xi

Background: To evaluate the feasibility and safety of balloon dilation over the jailed wire (BDJW) to re-open (sub) totally occluded side branch during provisional stenting for bifurcation lesions.

Methods: There were 23 bifurcation lesions (4 in right coronary artery, 19 in left anterior artery) in 23 cases with abrupt (sub) total occlusion of side branch (SB) after stent implantation in left main (LM) artery (LMA). The mean age was 63.1 years old (range 51-78) and 77% were male. BDJW was used as a bailout technique after failure of multiple rewiring attempts. Once the small balloon (1.25-1.5 mm) has successfully entered the SB ostium under the MB stent struts, it was inflated to reopen the SB, and another guidewire was Rewired from the true lumen of the MB stent. The small balloon (1.25-1.5 mm) has successfully entered the SB ostium under the MB stent struts, it was inflated to reopen the SB, and another guidewire was Rewired from the true lumen of the MB stent. The small balloon (1.25-1.5 mm) has successfully entered the SB ostium under the MB stent struts, it was inflated to reopen the SB, and another guidewire was Rewired from the true lumen of the MB stent.

Results: The percentage rate of success was 87% (20/23) and no serious compromises or repeat revascularization.

Conclusions: BDJW can be used as a bailout technique to facilitate rewiring with a 87% success rate in case of (sub) total SB occlusion during provisional stenting. Stent segment length >10mm proximal to SB ostium was associated with a lower success rate of this technique.

Impact of Treatment Strategy on Clinical Outcomes Differences Between Patients with Left Main and those with Non-Left Main Bifurcation Lesions
Young Bin Song1, Jin-Ho Choi2, Seung-Hyuk Choi3, Hyeon-Cheol Gwon4, Joo-Yong Hahn1, Sang Hoon Lee5, Jeong Hoon Yang2, 1Samsung Medical Center, Sungkyunkwan University School of Medicine, Seoul, Korea, Republic of, 2Samsung Medical Center, Seoul, Korea, Republic of

Background: We sought to investigate whether impact of bifurcation technique (1- versus 2-stent techniques) on clinical outcomes differed between patients with left main (LM) bifurcation lesion and those with non-LM bifurcation lesion.

Methods: A total of 2897 patients who received percutaneous coronary intervention for bifurcation lesions were enrolled from 18 centers in Korea between January 2003 and January 2010. Inclusion criteria: 1) coronary bifurcation lesions treated solely with drug-eluting stent and 2) a main vessel diameter of ≥2.5 mm and side branch diameter of ≥2.3 mm. The exclusion criteria were: 1) cardiogenic shock and 2) cardiopulmonary resuscitation before index procedure. Primary outcome was cardiac death or MI. Secondary outcome was target lesion failure (TLF) including cardiac death, myocardial infarction (MI), and target lesion revascularization.

Results: The median follow-up duration was 36 months. Among 2044 patients with non-LM bifurcation lesion, 1618 underwent 1-stent technique and 426 underwent 2-stent technique. The 2-stent group was more likely to have extensive coronary artery stenosis. After propensity-score matching, treatment with 2-stent technique was associated with a higher incidence of TLF (HR 1.59; 95% CI 1.13-2.24; p<0.01), but not of cardiac death (HR 0.95; 95% CI 0.32-2.85; p=0.93) and cardiac death or MI (HR 1.49; 95% CI 0.80-2.80; p=0.21). Among 853 patients with LM bifurcation lesions, 509 underwent 1-stent technique and 344 underwent 2-stent technique. After propensity-score matching, patients with 2-stent technique had a higher incidence of cardiac death (HR 2.66; 95% CI 1.10-6.40; p=0.02), cardiac death or MI (HR 2.31; 95% CI 1.21-4.42; p<0.01) as well as TLF (HR 3.08; 95% CI 2.04-4.64; p<0.01).

Conclusions: Compared with 1-stent technique, 2-stent technique was associated with a higher incidence of cardiac death or MI in patients with LM bifurcation lesion, but not in those with non-LM bifurcation lesion.

Impact of the syntax score on the outcome of the left main after drug-eluting stent implantation
Klaus Tiroch1, Julinda Mehilli2, Lars Bansemir3, Melchior Seyfarth3, Adnan Kastrati1
1HELIOS Klinikum, Wuppertal, Germany, 2NA, Munich, Germany, 3HELIOS Klinikum, Wuppertal, Germany

Background: There is a debate regarding the long term results for unprotected left main bifurcation disease (ULMCA) depending on the SYNTAX score.

Methods: This analysis is based on a randomized study of 607 patients with symptomatic coronary artery disease undergoing PCI for ULMCA. 302 were assigned to receive a PES and 305 assigned to receive a SES. We evaluated the prognostic impact of the syntax score on the angiographic restenosis rate (ISR) and the need of target lesion revascularisation (TLR) for the left main itself.

Results: The 3-year results showed a mortality rate of 5.8% and a TLR rate of 12.5%; 235 (39%) had a true bifurcation lesion (TBL, Medina 1,1,1), associated with a higher need for multiple stents (60% vs. 19%, P<0.001), with calcute-stenting in 78% and T-stenting in 22% of cases. From the overall population of 607 patients, 204 (34%) had SYNTAX scores ≤22, 234 (39%) had scores 23-32, and 169 (28%) had scores ≥33. For the 235 patients with TBL, the distribution was different from the overall population with 15 (6%), 102 (44%), and 118 (50%), P<0.001. Angiographic restenosis rates did not differ between the three categories (14% for scores ≤22, 19% for scores 23-32, 20% for scores ≥33, P=0.15). The need for repeat revascularization was similar for the three categories (13%, 19% and 12%, respectively, P=0.54).
