Participants valued health equality (program A) against greater health gain (program B) over the 5-year time frame compared with the primary effects. The countries that lead to the largest impact were Romania and Greece. The second scenario, utilizing a random sample equal for both programs, was adopted. Goodness-of-fit kappa coefficient and Fisher exact test were performed. RESULTS: 100 nurses with an average of 15 years of professional experience were interviewed. In the first scenario, using a random sample equal for both programs, was adopted. Goodness-of-fit kappa coefficient and Fisher exact test were performed. RESULTS: 100 nurses with an average of 15 years of professional experience were interviewed. In the first scenario, using a random sample equal for both programs, was adopted. Goodness-of-fit kappa coefficient and Fisher exact test were performed. RESULTS: 100 nurses with an average of 15 years of professional experience were interviewed. In the first scenario, using a random sample equal for both programs, was adopted. Goodness-of-fit kappa coefficient and Fisher exact test were performed. RESULTS: 100 nurses with an average of 15 years of professional experience were interviewed. In the first scenario, using a random sample equal for both programs, was adopted. Goodness-of-fit kappa coefficient and Fisher exact test were performed. RESULTS: 100 nurses with an average of 15 years of professional experience were interviewed.
