ABSTRACT

A questionnaire on asthma management was sent to 586 physicians, consisting of specialists authorized by the Japanese Society of Allergology and councillors of the society, who were treating patients with bronchial asthma. Of the total of 306 (52%) respondents in November 1993, 241 replied to questions relating to adult asthma and 129 to questions relating to childhood asthma (including duplicate replies).

Responses to the questionnaire on the diagnosis, patient education and management of asthma indicated that a reduced number of patients with severe asthma were seen in 1993 in both Pediatric and Internal Medicine Departments compared with 5 years before, despite the increase in total number of asthma patients in Japan. Specific IgE radioallergosorbent test (RAST) measurements were frequently performed instead of skin testing for diagnosis, and eosinophil count and bronchodilator response served as an adjunct to the diagnosis. Patients were frequently asked detailed questions about aspirin-induced asthma, which accounted for 8.8, 2.2 and 1.5% of patients with asthma in the adult, schoolchildren (6–16 years) and infant (≤ 5 years) groups, respectively. In achieving ‘control of asthma’, first priority was given to coping with the symptoms in children aged 5 years or less and to enabling routine daily life activities in patients 6 years of age or older. Usefulness of peak flow measurements was widely recognized and a detailed plan for allergen avoidance (house dust) was often given to patients.

Key words: asthma management, bronchial asthma, Japan, questionnaire survey

INTRODUCTION

The Bronchial Asthma Group of the Comprehensive Research Project on Allergy of the Ministry of Health and Welfare conducted a questionnaire survey in November 1993 to examine the current status of asthma management in Japan.

The questionnaire comprised questions relating to The Guidelines on Diagnosis and Treatment of Asthma of the Japanese Society of Allergology (1993),1 and the diagnosis, patient education, management and treatment of asthma by physicians treating asthma patients.

The results of this questionnaire have already been reported.2 In this paper, the results of the questionnaire survey on the diagnosis, patient education and management of asthma are reported.

METHODS

A questionnaire was sent to 586 physicians, including specialists authorized by the Japanese Society of Allergology and councillors of the society, who treated patients with asthma (Table 1). Of the total of 306 (52%) respondents, 177 were internists, 65 were pediatricians and 64 were physicians who saw patients in

both medical and pediatric departments. A total of 241 replied to the questions relating to adult asthma and 129 to those relating to childhood asthma. In the questionnaire, all patients with bronchial asthma were classified into three age groups: adults (>16 years), children (6–16 years) and infants (≤5 years).

The relevant questions are shown in Tables 2–4. The following instructions were given in the preamble of the questionnaire:

**Table 2** General information

1. In what year did you start your practice as a specialist?  
   16.8±10.0 yrs (Mean±S.D.) (Duration of practice)

2. Do you specialize in:  
   respiratory medicine? 40.8% (23.5°)
   general internal medicine? 14.4% (8.2)
   allergy in internal medicine? 34.3% (16.0)
   general pediatrics? 10.5% (2.6)
   pediatric allergy? 28.4% (19.3)
   allergy? 7.8% (1.5)
   No answer 0.7%

3. Within the total number of asthma patients, regularly followed by you, what percentage do you estimate to be within the following age ranges? (give %)
   1-5 yrs 35.0%
   6-16 yrs 25.4%
   17-44 yrs 28.7%
   over 65 yrs 19.4%

4. In your practice, are you seeing more patients with severe asthma than 5 years ago?  
   yes 19.9%
   no 71.9%
   not applicable or don’t know 6.5%
   No answer 0.6%

5. In your practice, are you seeing more asthmatic patients than 5 years ago?  
   yes 68.0%
   no 24.5%
   not applicable or don’t know 5.6%
   No answer 2.8%

6. Are you familiar with "The U.S. NIH International Consensus Report on Diagnosis and Management of Asthma" issued in 1992. guidelines on asthma management, which was drafted by members of the International Asthma Management Project?  
   yes 96.1%
   no 2.9%
   Not applicable or don’t know 1.0%
   No answer 0.0%

6.1) Do you know the contents?  
   yes 82.8%
   no 5.9%
   Not applicable or don’t know 1.3%

**Table 3** Diagnosis

1. In your diagnostic work up of asthma, please give the frequency you utilize or request each test

2) How often do you make your asthmatic patients know the difference between relieving (bronchodilators) and anti-inflammatory treatment (inhaled steroids or antihistamines)?

- Never (6.9%)
- Sometimes (18.0%)
- Often (36.9%)
- Always (37.6%)

3) How often do you ask your patients to keep a written daily record of peak expiratory flow rate (PEFR)?

- Never (16.0%)
- Sometimes (45.4%)
- Often (28.8%)
- Always (8.8%)

4) How often do you ask your patients to keep an asthma diary for recording their symptoms, such as asthmatic attacks?

- Never (7.8%)
- Sometimes (20.9%)
- Often (30.1%)
- Always (40.8%)

5) How often do you communicate to your patients your rating about the severity of their asthma?

- Never (3.6%)
- Sometimes (22.1%)
- Often (39.2%)
- Always (34.6%)

6) How often do you advise your patients to take the following criteria for recognizing life-threatening asthma attacks?

<table>
<thead>
<tr>
<th>Symptoms</th>

RESULTS

General Information

Answers to question 1 in Table 2 show the mean period of the respondents' practice as specialists was 18.8 years. Their specialities were diverse but not necessarily limited to one field, as reflected by the answers to question 2. The percentages (%) of the respondents by specialty are shown in parentheses.

Diagnosis

The questions and results are shown in Table 3.

Patient education and asthma management

The questions and results concerning patient education and asthma management are shown in Table 4. The order of priority for patients in achieving ‘control of asthma’ is shown in Table 4, question 1, with the percentages of physicians supporting it shown in parentheses.

DISCUSSION

This questionnaire survey was addressed to physicians specializing in the treatment of asthma patients.
The 1993 questionnaire survey on general information revealed an increase in the number of patients with asthma from 5 years previously, although no increase was observed in the number of patients having severe asthma. Results for departments of medicine and pediatrics were almost identical, although there was no specific classification in the questionnaire distinguishing examinations by internists and pediatricians. These findings reflect the recent increase in the number of patients with asthma in Japan.

For the diagnosis of asthma, serum specific IgE antibody screening and measurement of serum total IgE were more frequently performed than was skin testing. Peripheral blood eosinophil count and response to bronchodilators were frequently measured as adjuncts to the diagnosis. Patients were frequently asked detailed questions about aspirin-induced asthma. Mean percentages of patients with aspirin-induced asthma were 8.8%, 2.2% and 1.5% in the adult, children and infant groups, respectively.

For patient education and asthma management, slightly different priorities were assigned by the physicians in achieving ‘control of asthma’ depending on patient age. First priority was given to coping with symptoms for infants 5 years of age or less and second to enabling routine daily life activities for children six years or older. Normal respiratory function (forced expiratory volume in one second [FEV1] or peak expiratory flow [PEF]) was ranked last in achieving ‘control of asthma’, irrespective of age.

The usefulness of peak flow measurements in the treatment and management of asthma patients has been widely recognized. The present survey reveals that the majority of specialists recognize the importance of measuring the peak flow in relation to patient education and asthma management, although 16% of specialists replied ‘never’ to question 4 in Table 3: ‘How often do you ask your patients to keep written daily records of peak expiratory flow rate?’ A detailed plan for the removal of house dust was given to patients suffering from house dust allergy. Therefore, in addition to pharmacotherapy, the importance of improving environment was well recognized.

Results of the survey of the diagnosis, patient education and management of asthma, together with the results of the survey on asthma treatment have been reported separately. It should be emphasized that specialists who replied to the questionnaire on the diagnosis, patient education and management of asthma very much appreciated The Guidelines on Diagnosis and Treatment of Asthma in Japan.  

ACKNOWLEDGMENTS

We express our sincere appreciation to all those who co-operated with us in conducting this questionnaire survey. This study was supported by a research fund from the Bronchial Asthma Group of the Comprehensive Research Project on Allergy of the Ministry of Health and Welfare.
