Abstract
In this paper, using matrix method, we prove the Hyers–Ulam stability of a system of first order linear differential equations with constant coefficients.
© 2005 Elsevier Inc. All rights reserved.
Keywords: Hyers–Ulam stability; System of linear differential equations; Matrix method

1. Introduction
Let $X$ be a normed space over a scalar field $\mathbb{K}$, let $I$ be an open interval, and let $a_0, a_1, \ldots, a_{n-1}$ be fixed elements of $\mathbb{K}$. Assume that for a fixed continuous function $g : I \rightarrow X$ and for any $n$ times continuously differentiable function $y : I \rightarrow X$ satisfying the inequality
\[ \left\| y^{(n)}(t) + a_{n-1}y^{(n-1)}(t) + \cdots + a_1y'(t) + a_0y(t) + g(t) \right\| \leq \varepsilon \]
for all $t \in I$ and for a given $\varepsilon > 0$, there exists a function $y_0 : I \rightarrow X$ satisfying
\[ y_0^{(n)}(t) + a_{n-1}y_0^{(n-1)}(t) + \cdots + a_1y_0'(t) + a_0y_0(t) + g(t) = 0 \]

and \( \| y(t) - y_0(t) \| \leq K(\varepsilon) \) for any \( t \in I \), where \( K(\varepsilon) \) is an expression of \( \varepsilon \) with \( \lim_{\varepsilon \to 0} K(\varepsilon) = 0 \). Then, we say that the above differential equation has the Hyers–Ulam stability. For more detailed definition of the Hyers–Ulam stability, we may refer to [3–6, 12, 14].

Alsina and Ger were the first authors who investigated the Hyers–Ulam stability of differential equations: They proved in [1] that if a differentiable function \( y : I \to \mathbb{R} \) satisfies the differential inequality \( |y'(t) - y(t)| \leq \varepsilon \), where \( I \) is an open subinterval of \( \mathbb{R} \), then there exists a differentiable function \( y_0 : I \to \mathbb{R} \) satisfying \( y_0'(t) = y_0(t) \) and \( |y(t) - y_0(t)| \leq 3\varepsilon \) for any \( t \in I \).

This result of Alsina and Ger has been generalized by Takahasi et al. They proved in [13] that the Hyers–Ulam stability holds true for the Banach space valued differential equation \( y'(t) = \lambda y(t) \). Indeed, the Hyers–Ulam stability has been proved for the first order linear differential equations in more general settings (see [7–11]).

Suppose we are given a system of first order linear differential equations with complex coefficients of the following form:
\[
\begin{aligned}
    y'_1(t) &= a_{11}y_1(t) + a_{12}y_2(t) + \cdots + a_{1n}y_n(t) + b_1(t), \\
    y'_2(t) &= a_{21}y_1(t) + a_{22}y_2(t) + \cdots + a_{2n}y_n(t) + b_2(t), \\
    \vdots & \quad \vdots & \quad \vdots \\
    y'_n(t) &= a_{n1}y_1(t) + a_{n2}y_2(t) + \cdots + a_{nn}y_n(t) + b_n(t).
\end{aligned}
\]

This system may be written in a simple matrix notation
\[
\begin{align*}
    \vec{y}'(t) &= A\vec{y}(t) + \vec{b}(t) \\
    \vec{y}(t) &= \begin{pmatrix} y_1(t) \\ y_2(t) \\ \vdots \\ y_n(t) \end{pmatrix}, \\
    A &= \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix}, \\
    \vec{b}(t) &= \begin{pmatrix} b_1(t) \\ b_2(t) \\ \vdots \\ b_n(t) \end{pmatrix}.
\end{align*}
\]

In this paper, we will make use of matrix method to prove the Hyers–Ulam stability of the system (1) of linear differential equations. More precisely, we prove that if a continuously differentiable vector function \( \vec{y} : \mathbb{R} \to \mathbb{C}^n \) satisfies
\[
\| \vec{y}'(t) - A\vec{y}(t) - \vec{b}(t) \|_n \leq \varepsilon
\]
for all \( t \in \mathbb{R} \), where \( \| \cdot \|_n \) is a norm on \( \mathbb{C}^n \), then there exists a differentiable vector function \( \vec{y}_0 : \mathbb{R} \to \mathbb{C}^n \) and a constant \( K > 0 \) such that
\[
\begin{align*}
    \vec{y}_0'(t) &= A\vec{y}_0(t) + \vec{b}(t) \\
    \| \vec{y}(t) - \vec{y}_0(t) \|_n &\leq K\varepsilon
\end{align*}
\]
for all \( t \in \mathbb{R} \).

2. Preliminaries

Throughout this paper, let \((\mathbb{C}^n, \| \cdot \|_n)\) be a complex normed space and let \( \mathbb{C}^{n \times n} \) be a vector space consisting of all \((n \times n)\) complex matrices. We notice that for \( t \in \mathbb{R} \) and
A ∈ ℂ^{n×n} we use the notation At (instead of tA) for the scalar multiplication of t and A. We choose a norm || · ||_{n×n} on ℂ^{n×n} which is compatible with || · ||_n, i.e., both norms obey
\[ ||AB||_{n×n} \leq ||A||_{n×n}||B||_{n×n}, \quad ||A\vec{x}||_n \leq ||A||_{n×n}||\vec{x}||_n \]
(2)
for all A, B ∈ ℂ^{n×n} and \vec{x} ∈ ℂ^n.

Furthermore, we assume that ||\vec{c}||_n < ∞ and ||C||_{n×n} < ∞ for all \vec{c} ∈ ℂ^n and C ∈ ℂ^{n×n}. For any (u_1, …, u_n)^t, (w_1, …, w_n)^t ∈ ℂ^n with |u_i| ≤ w_i (i ∈ {1, …, n}), we assume that
\[ |u_i| \leq \|(u_1, …, u_n)^t\|_n \leq \|(w_1, …, w_n)^t\|_n, \]
(3)
where (w_1, …, w_n)^t is the transpose of the vector (w_1, …, w_n), i.e., (w_1, …, w_n)^t is a column vector.

Let A be a matrix in ℂ^{n×n}, n ≥ 2, and assume that A has d distinct eigenvalues \(\lambda_\mu\) with algebraic multiplicity \(n_\mu\) and geometric multiplicity \(m_\mu\), where \(\mu \in \{1, …, d\}\). Assume that \(\Lambda^-, \Lambda^0, \Lambda^+\) are the disjoint subsets of \{1, …, d\} such that \(\Lambda^- \cup \Lambda^0 \cup \Lambda^+ = \{1, …, d\}\) and the real part of \(\lambda_\mu\), say \(\Re(\lambda_\mu)\), satisfies
\[ \Re(\lambda_\mu) \begin{cases} < 0 & \text{for } \mu \in \Lambda^-, \\ = 0 & \text{for } \mu \in \Lambda^0, \\ > 0 & \text{for } \mu \in \Lambda^+. \end{cases} \]

We choose a nonsingular matrix \(N ∈ ℂ^{n×n}\) with \(N^{-1}AN = J\), where J is the Jordan form matrix of the form
\[
J = \begin{pmatrix}
J_{11} & & & \\
& \ddots & & O \\
& & \ddots & \\
& & & J_{dd}
\end{pmatrix}
\]
and the Jordan block \(J_{\mu\nu}\) is a \((p_{\mu\nu} \times p_{\mu\nu})\) matrix of the form
\[
J_{\mu\nu} = \begin{pmatrix}
\lambda_\mu & 1 & 0 & \cdots & 0 \\
0 & \lambda_\mu & 1 & \cdots & 0 \\
\vdots & \vdots & \ddots & \ddots & \vdots \\
0 & 0 & 0 & \ddots & 1 \\
0 & 0 & 0 & \cdots & \lambda_\mu
\end{pmatrix}
\]
for each \(\mu \in \{1, …, d\}\) and \(\nu \in \{1, …, m_\mu\}\). We notice that \(p_{\mu1} + \cdots + p_{\mu m_\mu} = n_\mu\) for any \(\mu \in \{1, …, d\}\).

For example, if the \(i\)th diagonal entry of J in (4) is one of the diagonal entries of \(J_{\mu\nu}\), then \(i\) satisfies
\[
(n_1 + \cdots + n_{\mu-1}) + (p_{\mu1} + \cdots + p_{\mu(v-1)}) < i \leq (n_1 + \cdots + n_{\mu-1}) + (p_{\mu1} + \cdots + p_{\mu v}).
\]
(5)
Furthermore, it holds that
\[
e^{At} = Ne^{J}N^{-1}
\]
(6)
if we set
\[ e^{Jt} = \begin{pmatrix}
  e^{J_{11}t} & & \\
  & \ddots & \\
  & & e^{J_{d,d}t}
\end{pmatrix}. \]

Let us denote by \( O_{\alpha\beta} \) the zero square matrix with \( p_{\alpha\beta} \) rows (columns). We replace each \( e^{J_{\alpha\beta}t} \) in the above \( e^{Jt} \) by \( O_{\alpha\beta} \), except \( e^{J_{\mu\nu}t} \), and we denote the resulting matrix by \( \langle e^{J_{\mu\nu}t} \rangle \), i.e.,
\[
\langle e^{J_{\mu\nu}t} \rangle = \begin{pmatrix}
  O & & & \\
  & \ddots & & \\
  & & O & \\
  & & & O
\end{pmatrix},
\]
where we simply write \( O \) instead of \( O_{\alpha\beta} \) as a matter of convenience. We notice that
\[
e^{J_{\mu\nu}t} = e^{\lambda_{\mu}t} \begin{pmatrix}
  1 & t & \frac{t^2}{2!} & \cdots & \frac{t^{p_{\mu\nu}-2}}{(p_{\mu\nu}-2)!} & \frac{t^{p_{\mu\nu}-1}}{(p_{\mu\nu}-1)!} \\
  0 & 1 & t & \cdots & \frac{t^{p_{\mu\nu}-3}}{(p_{\mu\nu}-3)!} & \frac{t^{p_{\mu\nu}-2}}{(p_{\mu\nu}-2)!} \\
  \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\
  0 & 0 & 0 & \cdots & 1 & t \\
  0 & 0 & 0 & \cdots & 0 & 1
\end{pmatrix},
\]
and
\[
e^{Jt} = \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_{\mu}} \langle e^{J_{\mu\nu}t} \rangle.
\]
For all \( \mu \in \{1, \ldots, d\} \) and \( \nu \in \{1, \ldots, m_{\mu}\} \), we define a \((p_{\mu\nu} \times p_{\mu\nu})\) matrix \( T_{\mu\nu} = (t_{ij}) \) by
\[
t_{ij} = \begin{cases}
|\Re(\lambda_{\mu})|^{-(j-i+1)} & \text{for } j \geq i, \\
0 & \text{for } j < i
\end{cases}
\]
and we replace any \( J_{\alpha\beta} \) in the \( J \) of (4) by \( O_{\alpha\beta} \) for each pair \((\alpha, \beta) \neq (\mu, \nu)\) and replace the \( J_{\mu\nu} \) by \( T_{\mu\nu} \), where \( O_{\alpha\beta} \) is the \((p_{\alpha\beta} \times p_{\alpha\beta})\) matrix whose all entries are zeros. The resulting matrix will be denoted by \( \langle T_{\mu\nu} \rangle \), i.e.,
\[
\langle T_{\mu\nu} \rangle = \begin{pmatrix}
  O & & & \\
  & \ddots & & \\
  & & O & \\
  & & & O
\end{pmatrix}.
\]
Given any positive numbers $\varepsilon^{(k)}_{\mu \nu}, k \in \{0, \ldots, p_{\mu \nu} - 1\}$, let us define a $(p_{\mu \nu} \times p_{\mu \nu})$ matrix $S_{\mu \nu} = (s_{ij})$ by

$$s_{ij} = \begin{cases} 
\varepsilon^{(j-i)}_{\mu \nu} & \text{for } j \geq i, \\
0 & \text{for } j < i,
\end{cases}$$

and we replace each $J_{\alpha \beta}$ in the $J$ of (4) by $O_{\alpha \beta}$ for every pair $(\alpha, \beta) \neq (\mu, \nu)$ and $J_{\mu \nu}$ by $S_{\mu \nu}$. We will use the notation $\langle S_{\mu \nu} \rangle$ for the resulting matrix:

$$\langle S_{\mu \nu} \rangle = \begin{pmatrix}
O & \cdots & O \\
\vdots & \ddots & \vdots \\
O & & O
\end{pmatrix}.$$  \hspace{1cm} (11)

Using (10) and (11), we define

$$\langle B_{\mu \nu} \rangle = \begin{cases}
\langle S_{\mu \nu} \rangle & \text{for } \mu \in \Lambda^0, \\
\langle T_{\mu \nu} \rangle & \text{for } \mu \in \Lambda^- \cup \Lambda^+,
\end{cases}$$

for any $\mu \in \{1, \ldots, d\}$ and $\nu \in \{1, \ldots, m_{\mu}\}$, and further define

$$B = \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_{\mu}} \langle B_{\mu \nu} \rangle.$$  \hspace{1cm} (12)

### 3. Main result

The following lemma can be easily proved by using the mathematical induction. Hence, we omit the proof.

**Lemma 1.** Let $m$ be a nonnegative integer.

(a) If $\lambda < 0$, then it holds that

$$\int_{-\infty}^{0} s^m e^{-\lambda s} \, ds = -\frac{m!}{\lambda^{m+1}}$$

and

$$\int_{-\infty}^{t} (t-s)^m e^{\lambda(t-s)} \, ds = \frac{(-1)^m m!}{\lambda^{m+1}}$$

for any $t \in \mathbb{R}$.

(b) If $\lambda > 0$, then it holds that

$$\int_{0}^{\infty} s^m e^{-\lambda s} \, ds = \frac{m!}{\lambda^{m+1}}$$

and

$$\int_{t}^{\infty} (t-s)^m e^{\lambda(t-s)} \, ds = \frac{(-1)^m m!}{\lambda^{m+1}}$$

for any $t \in \mathbb{R}$. 

Using the notations and assumptions given in the preceding section, we will prove the Hyers–Ulam stability of the system (1) of first order linear differential equations with constant coefficients.

**Theorem 2.** In addition to the assumptions in Section 2, let \( \vec{b} : \mathbb{R} \rightarrow \mathbb{C}^n \) and \( \vec{y} : \mathbb{R} \rightarrow \mathbb{C}^n \) be a continuous vector function and a continuously differentiable vector function, respectively. Assume that a continuous vector function \( \vec{v} : \mathbb{R} \rightarrow \mathbb{C}^n \) defined by

\[
\vec{v}(t) = \vec{y}'(t) - A\vec{y}(t) - \vec{b}(t) \tag{13}
\]

satisfies

\[
\| \vec{v}(t) \|_n \leq \varepsilon \tag{14}
\]

for all \( t \in \mathbb{R} \) and for some \( \varepsilon > 0 \). Suppose that for each \( \mu \in \Lambda^0 \), there exist positive numbers \( \varepsilon_{(k)}^{(k)} \) such that

\[
\int_{-\infty}^{\infty} |t - s|^k |\left[ N^{-1}\vec{v}(s) \right]_i | ds \leq k! \varepsilon_{(k)}^{(k)} \varepsilon \| N^{-1} \|_{n \times n} \tag{15}
\]

for all \( t \in \mathbb{R} \), all \( v \in \{1, \ldots, m_\mu\} \), any integers \( i \) satisfying (5), and for any \( k \in \{0, \ldots, p_{\mu v} - 1\} \), where \( N \) is a nonsingular matrix such that \( N^{-1}AN \) is a Jordan form matrix (see (4)) and \( [N^{-1}\vec{v}(s)]_i \) denotes the \( i \)th component of \( N^{-1}\vec{v}(s) \). Then there exists a differentiable vector function \( \vec{y}_0 : \mathbb{R} \rightarrow \mathbb{C}^n \) such that

\[
\vec{y}_0'(t) = A\vec{y}_0(t) + \vec{b}(t) \tag{16}
\]

and

\[
\| \vec{y}(t) - \vec{y}_0(t) \|_n \leq \varepsilon \| N \|_{n \times n} \| N^{-1} \|_{n \times n} \| \vec{b} \|_n
\]

for all \( t \in \mathbb{R} \), where \( \vec{e} = (1, 1, \ldots, 1)^{\text{tr}} \in \mathbb{C}^n \).

**4. Proof of Theorem 2**

By (13), we have

\[
\vec{y}'(t) = A\vec{y}(t) + \vec{b}(t) + \vec{v}(t) \tag{17}
\]

for all \( t \in \mathbb{R} \). We notice that \( N \in \mathbb{C}^{n \times n} \) is a nonsingular matrix for which \( J = N^{-1}AN \) is a Jordan matrix of the form (4). In this proof, we use the notations \( e^{At} \), \( \langle e^{J_{\mu v}t} \rangle \) and \( e^{J_{\mu v}t} \) and refer to (6), (7) and (8) for their details.

In view of [15, §16] (cf. [2, Chapter 31]), the solution of (17) is

\[
\vec{y}(t) = e^{At} \vec{y}(0) + e^{At} \int_0^t e^{-As} \vec{b}(s) ds + e^{At} \int_0^t e^{-As} \vec{v}(s) ds \tag{18}
\]

for all \( t \in \mathbb{R} \).
Set $\vec{w}(t) = N^{-1} \vec{v}(t) = (w_1(t), \ldots, w_n(t))^\text{tr}$ and for every fixed $\mu \in \{1, \ldots, d\}$ and $\nu \in \{1, \ldots, m_\mu\}$, let us define a column vector $\langle \vec{w}_{\mu\nu}(t) \rangle$ by

$$
\text{the } i\text{th component of } \langle \vec{w}_{\mu\nu}(t) \rangle = \begin{cases} w_i(t) & \text{if } i \text{ satisfies (5)}, \\ 0 & \text{otherwise}. \end{cases}
$$

Then, we have

$$
\vec{w}(t) = \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \langle \vec{w}_{\mu\nu}(t) \rangle.
$$

It now follows from (6), (7), (9) and the last equality that

$$
e^{-A_s} \vec{v}(s) = (Ne^{-Js})(N^{-1} \vec{v}(s)) = N(e^{-Js} \vec{w}(s))
$$

$$
= N \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \sum_{\rho=1}^{d} \sum_{\sigma=1}^{m_\rho} \langle \vec{w}_{\rho\sigma}(s) \rangle
$$

$$
= N \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle
$$

and

$$
\int_0^t e^{-A_s} \vec{v}(s) \, ds = N \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \int_0^t \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds,
$$

where $\int_0^t \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds$ is a column vector with $n$ components.

Let us define

$$
\langle \vec{c}_{\mu\nu} \rangle = \begin{cases} -\int_{-\infty}^0 \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds & \text{for } \mu \in \Lambda^-, \\ (0, 0, \ldots, 0)^\text{tr} & \text{for } \mu \in \Lambda^0, \\ \int_0^\infty \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds & \text{for } \mu \in \Lambda^+ \end{cases}
$$

and

$$
\langle \vec{f}_{\mu\nu}(t) \rangle = \begin{cases} \int_{-\infty}^t \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds & \text{for } \mu \in \Lambda^-, \\ \int_0^t \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds & \text{for } \mu \in \Lambda^0, \\ -\int_t^\infty \langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds & \text{for } \mu \in \Lambda^+. \end{cases}
$$

From now on, we set

$$
i_{\mu\nu} = (n_1 + \cdots + n_{\mu-1}) + (p_{\mu1} + \cdots + p_{\mu(v-1)})
$$

for any fixed $\mu \in \{1, \ldots, d\}$ and $\nu \in \{1, \ldots, m_\mu\}$, where $p_{\mu0} = 0$ for any $\mu \in \{1, \ldots, d\}$. In view of (7) and (8), the $i$th component of $\langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle$ is given below:

$$
\left[\langle e^{-J_{\mu\nu}s} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle\right]_i = \begin{cases} e^{-\lambda_{\mu}s} \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{(-s)^{k-i}}{(k-i)!} w_k(s) & \text{if } i \text{ satisfies (5)}, \\ 0 & \text{otherwise}. \end{cases}
$$
Hence, Lemma 1 implies that \( \int_{-\infty}^{0} [\langle e^{-J_{\mu \nu} s} \rangle (\bar{w}_{\mu \nu}(s)) ] ds \) or \( \int_{0}^{\infty} [\langle e^{-J_{\mu \nu} s} \rangle (\bar{w}_{\mu \nu}(s)) ] ds \) is bounded for \( \mu \in \Lambda^- \) or \( \mu \in \Lambda^+ \), respectively, because it follows from (2), (3) and (14) that
\[
|w_k(s)| \leq \| N^{-1} \bar{v}(s) \|_n \leq \varepsilon \| N^{-1} \|_{n \times n}.
\]

Thus, \( \langle \bar{c}_{\mu \nu} \rangle \) is a constant vector.

By (19) and (20), we obtain
\[
\int_{0}^{t} e^{-A_s \bar{v}(s)} ds = N \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \left( \bar{c}_{\mu \nu} + \bar{r}_{\mu \nu}(t) \right).
\]

If we set
\[
\bar{c} = \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \langle \bar{c}_{\mu \nu} \rangle \quad \text{and} \quad \bar{r}(t) = \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} \langle \bar{r}_{\mu \nu}(t) \rangle,
\]

then it follows from (6) and (22) that
\[
e^{At} \int_{0}^{t} e^{-A_s \bar{v}(s)} ds = Ne^{Jt} (\bar{c} + \bar{r}(t)).
\]

We now define
\[
\bar{y}_0(t) = e^{At} \left\{ \bar{y}(0) + N \bar{c} \right\} + e^{At} \int_{0}^{t} e^{-A_s \bar{b}(s)} ds
\]
for all \( t \in \mathbb{R} \). By applying (18), (25), (24), (6), (2), (9), (23), and (20) in order, we get
\[
\| \bar{y}(t) - \bar{y}_0(t) \|_n = \| Ne^{Jt} \bar{r}(t) \|_n \leq \| N \|_{n \times n} \| e^{Jt} \bar{r}(t) \|_n
\]
\[
= \| N \|_{n \times n} \left\| \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} (e^{J_{\mu \nu} t}) \sum_{\rho=1}^{d} \sum_{\sigma=1}^{m_\rho} \bar{r}_{\rho \sigma}(t) \right\|_n
\]
\[
= \| N \|_{n \times n} \left\| \sum_{\mu=1}^{d} \sum_{\nu=1}^{m_\mu} (e^{J_{\mu \nu} t}) \bar{r}_{\mu \nu}(t) \right\|_n
\]
\[
= \| N \|_{n \times n} \left\| \sum_{\mu \in \Lambda^-} \sum_{\nu=1}^{m_\mu} (e^{J_{\mu \nu} t}) \int_{-\infty}^{t} \langle e^{-J_{\mu \nu} s} \rangle (\bar{w}_{\mu \nu}(s)) ds \right\|_n
\]
\[
+ \sum_{\mu \in \Lambda^0} \sum_{\nu=1}^{m_\mu} (e^{J_{\mu \nu} t}) \int_{0}^{t} \langle e^{-J_{\mu \nu} s} \rangle (\bar{w}_{\mu \nu}(s)) ds
\]
\[
- \sum_{\mu \in \Lambda^+} \sum_{\nu=1}^{m_\mu} (e^{J_{\mu \nu} t}) \int_{t}^{\infty} \langle e^{-J_{\mu \nu} s} \rangle (\bar{w}_{\mu \nu}(s)) ds \right\|_n.
\]
A somewhat tedious calculation, together with (7) and (8), leads to the conclusion that
\[ \langle e^{J_{\mu
u}t} \rangle \langle e^{-J_{\mu\nu}s} \rangle = \langle e^{J_{\mu\nu}(t-s)} \rangle \]
holds for all \( s, t \in \mathbb{R} \). Therefore, we further obtain
\[ \| \vec{y}(t) - \vec{y}_0(t) \|_n = \| N \|_{n \times n} \left\| \sum_{\mu \in \Lambda^+} \sum_{v=1}^{m_{\mu}} \int_{-\infty}^{t} \langle e^{J_{\mu
u}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds \right\|_n \]
\[ + \sum_{\mu \in \Lambda^0} \sum_{v=1}^{m_{\mu}} \int_{0}^{t} \langle e^{J_{\mu
u}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds \]
\[ - \sum_{\mu \in \Lambda^+} \sum_{v=1}^{m_{\mu}} \int_{t}^{\infty} \langle e^{J_{\mu\nu}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds \right\|_n \]
for all \( t \in \mathbb{R} \).

Let \( \mu \in \Lambda^+ \) be given. In view of (7) and (8) (or Ref. (21)), the \( i \)th component of \( \langle e^{J_{\mu
u}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \) is
\[ \left[ \langle e^{J_{\mu\nu}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \right]_i = \left\{ \begin{array}{ll}
   e^{\lambda_{\mu}(t-s)} \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{(t-s)^{k-i}}{(k-i)!} \vec{w}(s) & \text{if } i \text{ satisfies (5)}, \\
   0 & \text{otherwise}.
\end{array} \right. \] (27)

Hence, the \( i \)th component \( \alpha_i \) of \( \langle T_{\mu\nu} \rangle \vec{e} \) is
\[ \alpha_i = \left\{ \begin{array}{ll}
   \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{1}{(k-i)!} \int_{-\infty}^{t} (t-s)^{k-i} e^{\Re(\lambda_{\mu})(t-s)} \| \vec{w}(s) \|_n \, ds & \text{if } i \text{ satisfies (5)}, \\
   0 & \text{otherwise}.
\end{array} \right. \]

Now, by using (2), (3), (14) and Lemma 1(a), we have
\[ |\alpha_i| \leq \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{1}{(k-i)!} \int_{-\infty}^{t} (t-s)^{k-i} e^{\Re(\lambda_{\mu})(t-s)} \| \vec{w}(s) \|_n \, ds \]
\[ \leq \varepsilon \| N^{-1} \|_{n \times n} \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} |\Re(\lambda_{\mu})|^{-k+i-1} \]
for each \( i \) satisfying (5), and \( |\alpha_i| \leq 0 \) if (5) is not satisfied with \( i \).

On account of (10), the \( i \)th component \( \langle T_{\mu\nu} \rangle \vec{e} \) of \( \langle T_{\mu\nu} \rangle \vec{e} \) is
\[ \left[ \langle T_{\mu\nu} \rangle \vec{e} \right]_i = \left\{ \begin{array}{ll}
   \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} |\Re(\lambda_{\mu})|^{-k+i-1} & \text{if } i \text{ satisfies (5)}, \\
   0 & \text{otherwise},
\end{array} \right. \]
where \( \vec{e} = (1, 1, \ldots, 1)^T \). Hence, we get
\[ |\alpha_i| \leq \varepsilon \| N^{-1} \|_{n \times n} \left[ \langle T_{\mu\nu} \rangle \vec{e} \right]_i \] (28)
for all \( i \in \{1, \ldots, n\} \).

If \( \mu \in \Lambda^+ \) is arbitrarily given and if we denote by \( \beta_i \) the \( i \)th component of
\[ \int_{t}^{\infty} \langle e^{J_{\mu\nu}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle \, ds, \]
then we obtain by a similar argument that
\[ |\beta_i| \leq \varepsilon \|N^{-1}\|_{n \times n} \left[ (T_{\mu\nu}) \vec{e} \right]_i \]  
(29)
for any \( i \in \{1, \ldots, n\} \).

Now, let \( \mu \in A^0 \) be given, and let \( \gamma_i \) be the \( i \)th component of
\[ \int_0^t \langle e^{J_{\mu\nu}(t-s)} \rangle \langle \vec{w}_{\mu\nu}(s) \rangle ds. \]

In view of (27), we get
\[ \gamma_i = \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{1}{(k-i)!} \int_0^t (t-s)^{k-i} e^{t-x_{\mu\nu}(s)} ds \]
if \( i \) satisfies (5), otherwise.

Using (2), (3) and (15), we have
\[ |\gamma_i| \leq \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \frac{1}{(k-i)!} \left| \int_0^t |t-s|^{k-i} w_k(s) \right| ds \]
\[ \leq \varepsilon \|N^{-1}\|_{n \times n} \sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \varepsilon^{(k-i)} \]
for each \( i \) satisfying (5), and \( |\gamma_i| \leq 0 \) if (5) is not satisfied with \( i \).

According to (11), the \( i \)th component of \( \langle S_{\mu\nu} \rangle \vec{e} \) is
\[ \left[ \langle S_{\mu\nu} \rangle \vec{e} \right]_i = \left\{ \begin{array}{ll}
\sum_{k=i}^{i_{\mu\nu}+p_{\mu\nu}} \varepsilon^{(k-i)} & \text{if } i \text{ satisfies (5)}, \\
0 & \text{otherwise}
\end{array} \right. \]
and hence
\[ |\gamma_i| \leq \varepsilon \|N^{-1}\|_{n \times n} \left[ \langle S_{\mu\nu} \rangle \vec{e} \right]_i \]  
(30)
for each \( i \in \{1, \ldots, n\} \).

Consequently, it follows from (3), (26), (28), (29), (30) and (12) that
\[ \left\| \vec{y}(t) - \vec{y}_0(t) \right\|_n \leq \|N\|_{n \times n} \left\| \sum_{\mu \in A^- \cup A^+} \varepsilon \|N^{-1}\|_{n \times n} \left( T_{\mu\nu} \right) \vec{e} \right. \\
+ \left. \sum_{\mu \in A^0} \sum_{\nu=1}^{m_{\mu}} \varepsilon \|N^{-1}\|_{n \times n} \left( S_{\mu\nu} \right) \vec{e} \right\|_n = \varepsilon \|N\|_{n \times n} \|N^{-1}\|_{n \times n} \|\vec{B}\|_n \]
for all \( t \in \mathbb{R} \).

According to [2, Chapter 31] (cf. [15, §16]), \( \vec{y}_0(t) \) is a solution of the system (1) of linear differential equations (see (25)), or equivalently, \( \vec{y}_0(t) \) satisfies the differential equation (16) for all \( t \in \mathbb{R} \). \( \Box \)
5. Some examples

Some of the most important matrix norms are induced by \( p \)-norms. For \( 1 \leq p \leq \infty \), the norm induced by the \( p \)-norm,

\[
\|A\|_p = \sup_{\|\vec{x}\|_p \neq 0} \frac{\|A\vec{x}\|_p}{\|\vec{x}\|_p} \quad (A \in \mathbb{C}^{n \times n}),
\]

is called the matrix \( p \)-norm. For example, we get

\[
\|A\|_1 = \max_{1 \leq j \leq n} \sum_{i=1}^{n} |a_{ij}|, \quad \|A\|_\infty = \max_{1 \leq i \leq n} \sum_{j=1}^{n} |a_{ij}|.
\]

It is well known that the matrix \( p \)-norm, together with the \( p \)-norm, satisfies both conditions in (2).

Example 1. We consider a system of first order linear differential equations of the following form

\[
\begin{align*}
    y_1'(t) &= y_1(t) + 2y_2(t) + b_1(t), \\
    y_2'(t) &= 3y_1(t) + 2y_2(t) + b_2(t).
\end{align*}
\]

This system can be written in a matrix notation

\[
\vec{y}'(t) = A\vec{y}(t) + \vec{b}(t),
\]

where

\[
\vec{y}(t) = \begin{pmatrix} y_1(t) \\ y_2(t) \end{pmatrix}, \quad A = \begin{pmatrix} 1 & 2 \\ 3 & 2 \end{pmatrix}, \quad \vec{b}(t) = \begin{pmatrix} b_1(t) \\ b_2(t) \end{pmatrix}.
\]

Assume that a continuous vector function \( \vec{b}: \mathbb{R} \to \mathbb{C}^2 \) and a continuously differentiable vector function \( \vec{y}: \mathbb{R} \to \mathbb{C}^2 \) satisfy

\[
\|\vec{y}'(t) - A\vec{y}(t) - \vec{b}(t)\|_\infty \leq \varepsilon
\]

for all \( t \in \mathbb{R} \) and for some \( \varepsilon \geq 0 \).

Since \( A \) has two distinct eigenvalues \(-1\) and \(4\), we can choose a nonsingular matrix \( N \) and a diagonal matrix \( J \)

\[
N = \begin{pmatrix} 1 & 2 \\ -1 & 3 \end{pmatrix}, \quad J = \begin{pmatrix} -1 & 0 \\ 0 & 4 \end{pmatrix}
\]

such that \( J = N^{-1}AN \). Furthermore, since \( d = 2, m_1 = m_2 = 1 \) and \( p_{11} = p_{21} = 1 \), it follows from (12) that

\[
B = \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{4} \end{pmatrix}.
\]

According to Theorem 2 and (25), there exists a differentiable vector function \( \vec{y}_0: \mathbb{R} \to \mathbb{C}^2 \) of the form

\[
\vec{y}_0(t) = e^{At}\vec{k} + e^{At} \int_0^t e^{-As}\vec{b}(s) \, ds
\]
with
\[ \| \vec{y}(t) - \vec{y}_0(t) \|_\infty \leq 4\epsilon \]
for all \( t \in \mathbb{R} \), where \( \vec{k} \in \mathbb{C}^2 \) is a constant.

If we set \( \vec{b}(t) = \vec{0} \) in the above example, then there exist two constants \( k_1 \) and \( k_2 \) such that the functions \( y_{01}, y_{02} : \mathbb{R} \to \mathbb{C} \) defined by
\[
y_{01}(t) = \left( \frac{3}{5}k_1 - \frac{2}{5}k_2 \right) e^{-t} + \left( \frac{2}{5}k_1 + \frac{2}{5}k_2 \right) e^{4t},
y_{02}(t) = \left( -\frac{3}{5}k_1 + \frac{2}{5}k_2 \right) e^{-t} + \left( \frac{3}{5}k_1 + \frac{3}{5}k_2 \right) e^{4t}
\]
satisfy the system (31) of differential equations as well as the inequality
\[
\max \{|y_1(t) - y_{01}(t)|, |y_2(t) - y_{02}(t)|\} \leq 4\epsilon
\]
for each \( t \in \mathbb{R} \).

**Example 2.** Assume that \( y_1, y_2, y_3 : \mathbb{R} \to \mathbb{C} \) are continuously differentiable functions and satisfy the inequality
\[
\| \vec{y}'(t) - A\vec{y}(t) - \vec{b}(t) \|_\infty \leq \epsilon
\]
for all \( t \in \mathbb{R} \) and for some \( \epsilon \geq 0 \), where
\[
\vec{y}(t) = \begin{pmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{pmatrix}, \quad A = \begin{pmatrix} -2 & 2 & -3 \\ 2 & 1 & -6 \\ -1 & -2 & 0 \end{pmatrix}, \quad \vec{b}(t) = \begin{pmatrix} b_1(t) \\ b_2(t) \\ b_3(t) \end{pmatrix},
\]
and \( b_1, b_2, b_3 : \mathbb{R} \to \mathbb{C} \) are continuous functions.

We can easily choose a nonsingular matrix \( \mathbf{N} \) and a diagonal matrix \( \mathbf{J} \)
\[
\mathbf{N} = \begin{pmatrix} -2 & 3 & 1 \\ 1 & 0 & 2 \\ 0 & 1 & -1 \end{pmatrix}, \quad \mathbf{J} = \begin{pmatrix} -3 & 0 & 0 \\ 0 & -3 & 0 \\ 0 & 0 & 5 \end{pmatrix}, \quad \mathbf{N}^{-1} = \begin{pmatrix} -\frac{1}{4} & \frac{1}{4} & \frac{3}{4} \\ \frac{1}{8} & \frac{1}{4} & \frac{5}{8} \\ \frac{1}{8} & \frac{1}{4} & -\frac{3}{8} \end{pmatrix}
\]
such that \( \mathbf{J} = \mathbf{N}^{-1} \mathbf{A} \mathbf{N} \). Furthermore, since \( d = 2, m_1 = n_1 = 2, m_2 = n_2 = 1 \) and \( p_{11} = p_{12} = p_{21} = 1 \), it follows from (12) that
\[
\mathbf{B} = \begin{pmatrix} \frac{1}{3} & 0 & 0 \\ 0 & \frac{1}{3} & 0 \\ 0 & 0 & \frac{1}{3} \end{pmatrix}.
\]

According to Theorem 2, there exists a differentiable vector function \( \tilde{y}_0 : \mathbb{R} \to \mathbb{C}^3 \) satisfying \( \tilde{y}'_0(t) = \mathbf{A} \tilde{y}_0(t) + \tilde{b}(t) \) as well as
\[
\| \tilde{y}(t) - \tilde{y}_0(t) \|_\infty \leq 3\epsilon
\]
for all \( t \in \mathbb{R} \). Moreover, due to (25), there exists a constant \( \vec{k} \in \mathbb{C}^3 \) such that \( \vec{y}_0(t) \) has the following form

\[
\vec{y}_0(t) = e^{A t} \vec{k} + e^{A t} \int_0^t e^{-A s} \vec{b}(s) \, ds.
\]
