OBJECTIVES: Patient-reported outcome (PRO) measures provide patients and clinicians with objective, subjective, and psychological information. Individual- and aggregated data can inform treatment decision making and aid patient management. Existing PRO measures for psoriasis typically do not fully capture either impact on emotional wellbeing or coping behaviors, including modifiable behavioral factors. To this end, the present study aimed to validate the oral acceptability with cefovecin sodium as a first line of therapy in 76.2% of the population. Further confirmation and refinement of items, scales, and scoring structure is planned through additional testing. A conceptual model is presented, postulating relationships between concepts identified by patients. An initial bank of 97 items was developed, cognitive debriefing revealed that most items were deemed relevant to patient experience and could be accurately recalled over a 14-day time period. Six items were deleted through redundancy, lack of relevance, or poor understanding. A 91-item bank across six sub-scales remained.

RESULTS: A 91-item bank across six sub-scales remained. Client- and content validity in a plaque psoriasis patient population. per-prescription of branded (Ciplox) ciprofloxacin was $149.34. The sharp decrease in the prescription of the generic oxolinic can be explained by the withdrawal from the market in 2001 because of risk of liver failure. CONCLUSIONS: Increased expenditures for fluoroquinolones paralleled with increased utilization. Generic drug utilization increased dramatically after brand-name patent expiration. Fluoroquinolone drug utilization was also associated with its safety profile and related disease treatment guidelines.

PSS41 ASSOCIATION OF OBESITY WITH 30-DAY READMISSION RATES AMONG PATIENTS HOSPITALIZED WITH ACUTE BACTERIAL SKIN AND SKIN-SURFACE INFECTIONS (ABSSSI)

Aragam K.1, Revol C.1, Tang W.1, Faust F.1, Turtle KG.1

1Analysis Group Inc, Boston, MA, USA, 2Analysis Group Inc, New York, NY, USA, 3Analysis Group Inc, Menlo Park, CA, USA

OBJECTIVES: Obesity has been associated with increased risk of soft tissue infection and clinical failure; however, the association between obesity and longer-term clinical outcomes in ABSSSI patients is not well-studied. This study compared hospital readmission rates between obese and non-obese ABSSSI patients. METHODS: Adults (>18 years) hospitalized with 3,1 primary ABSSSI diagnosis were selected from the Cerner HealthLfacts electronic medical records database (2009-2013). The first primary ABSSSI inpatient admission was defined as the index admission. Patients were classified as obese (BMI>30) or non-obese at the index admission. Proportions of patients with all-cause and ABSSSI-related readmission to the same hospital within 30 days were compared between the cohorts descriptively (in subgroups defined by gender, age, and causative pathogens) and using multivariable regression adjusting for hospital size, demographics, insurance type, causative pathogen, and important comorbidities. RESULTS: 5,882 obese and 5,882 non-obese patients were identified. Fewer obese patients were male (47.8% vs 52.2%), younger (mean age 65.0 years vs 65.8 years) and admitted to teaching hospitals (70.7% vs 73.4%). Same-hospital 30-day readmission rates were higher for obese patients for both all-cause (12.9% vs 11.8%, p=0.085) and ABSSSI-related (5.3% vs 4.0% p=0.0019) readmissions. Adjusted multivariable readmission rates were significantly higher for obese patients among males (5.1% vs 3.8%, p=0.0088), younger patients (age <65 years, 5.0% vs 3.6%, p=0.0026), and those not infected with methicillin-resistant staphylococcus aureus (3.5% vs 4.2%, p=0.0499). In multivariable regressions, obese patients had higher odds of 30-day readmission for all-cause readmissions (obese vs non-obese: OR=1.10, p=0.0944) and significantly higher odds of ABSSSI-related readmissions (OR=1.28, p=0.0073). CONCLUSIONS: Obese ABSSSI patients experienced higher rates of same-hospital ABSSSI-related readmission compared with non-obese patients. The association persisted in male, age <65, and non-MRSA subgroups and remained significant after adjustment for confounding. Further studies are warranted to estimate total readmission rates, which may be underestimated by same-hospital readmission rates.

PSS42 BIBLIOMETRIC ANALYSIS OF THE WORLDWIDE SCIENTIFIC PRODUCTION OF ORAL HEALTH

Simbaqueba E., Zarama P., Robles A., Upegui A.

Universidad de los Andes, Bogota, Colombia

OBJECTIVES: To identify and analyze the level of scientific production in the oral health field worldwide, by applying quantitative assessment counting methods and bibliometric analysis. METHODS: The review was realized using the Scopus database, given its greater coverage according to The Academic Database Evaluation Tool. The results were analyzed through production, dissemination, collaboration and bibliometric indicators, which considered the trends in publication, authors, document type, workspace, magazines, country, number of citations, impact factor, h-index, and co-authorship. A descriptive analysis was performed from the public policy context in oral health, in addition to the estimation of trends and state of the art investigation. RESULTS: 1,727 scientific articles were found through research terms associated with "oral health" AND "policy" and "public policy". The annual growth function provided an increased trend since 2000. The United States, Brazil and the United Kingdom were the countries with the highest impact and development in the oral health field, providing 40.7% of the total references found. The production is allied especially to universities and research groups, mainly the University of Sao Paulo, University of Adelaide and University of North Carolina at Chapel Hill. The areas of knowledge with the greater incidence were: medicine (44.1%), Dentistry (35%) and social sciences (4.8%). The search for oral health had an index h: 46. CONCLUSIONS: The scientific production in the oral health topics shows increasing development and institutional role because it is expected that the oral health problems analyzed would have solutions and support from the government of the region and the allocation of resources for health.

PSS43 BIOLOGIC ADHERENCE AMONG PSORIASIS PATIENTS IN THE US MEDICARE POPULATION

1University of Pennsylvania, Philadelphia, PA, USA, 2Amgen, Thousand Oaks, CA, USA, 3University of Pennsylvania - The Wharton School, Philadelphia, PA, USA, 4Hospital of the University of Pennsylvania, Philadelphia, PA, USA

OBJECTIVES: Biologics have provided major advances in the treatment of plaque psoriasis. Little is known regarding adherence to biologics and factors associated with adherence in the Medicare population. This study is the first to examine adherence of Medicare patients with psoriasis receiving biologics. METHODS: The 2009 to 2012 Medicare 100% files were used to identify patients who received infliximab, ustekinumab, adalimumab, or etanercept between 1/1/2010 and 12/31/2011. The date of first biologic prescription defined the index date. Patients were required to have fee-for-service Medicare Parts A, B, and stand-alone Part D plan coverage in the 12-month pre- and post-index period. Overall, >1 claim for psoriasis (ICD-ICM code 696.1) in the 12-month pre-index period. Exclusion criteria included presence of other conditions for which these biologics are indicated, or receipt of any biologic in the 12-month pre-index. Adherence to index biologic was defined as patients with proportion of days covered (PDC) > 0.90 during the 12-months post-index. Logistic regression analyses were conducted to determine the factors associated with being adherent. RESULTS: Our sample included 2,707 patients newly initiating biologics. Overall mean PDC for any index biologic was 0.61 and only 38% were adherent to their index biologic in the 12 months following initiation. Mean PDC and adherence rates were similar between physician-administered and self-administered agents, but there were several differences by index biologic: Mean PDCs were 0.66 for infliximab (N=1,318), 0.70 for ustekinumab (N=298), 0.63 for adalimumab (N=1,084), and 0.56 for etanercept (N=1,025). Adherence rates were 49%, 43%, 41%, and 29%, respectively. Logistic regression indicated that older age, and female gender were associated with poorer adherence. In contrast, biologic adherence to psoriasis therapy was poor in the Medicare population with rates <50% across all biologics.

URINARY/KIDNEY DISORDERS – Clinical Outcomes Studies

PUS4 COMPARATIVE EFFICACY OF INTERVENTIONS FOR OVERACTIVE BLADDER SYNDROME: A SYSTEMATIC REVIEW AND NETWORK META-ANALYSIS

Doshi J.A., Nipolic D.G., Bujkiewicz S., Abrams K.

University of Leicester, Leicester, UK

OBJECTIVES: There is a plethora of interventions for the treatment of overactive bladder syndrome (OAB) in primary care, including behavioral therapy, anticholinergic medication, sacral nerve stimulation, and more recently, botulinum toxin type A (BoNT-A) and beta-3-adrenergic agonists. Though these therapies have demonstrated utility, it is unclear which is most effective. This study aimed to explore this relationship with meta-analysis of the exchangeability between different classes of managements. METHODS: We searched Medline, EMBASE, Cochrane Incontinence Group Specialized Register, and all relevant references for randomized controlled trials evaluating interventions for OAB from March 2014 to October 2014. Using Bayesian Markov Chain Monte Carlo (MCMC) methods, we applied a hierarchical network meta-analysis that accounts for the exchangeability of treatment effects between different modes of administration (e.g. extended and immediate release), between treatments within the same class, and the anticholinergic residual beneﬁt. We further adjusted for differences in baseline severity of the patient population, as different interventions are used at varying times in the treatment pathway. The primary outcomes of interest were mean change from baseline for voiding, urgency, and incontinence episodes. RESULTS: Preliminary results show that for voiding and urgency episodes, BoNT-A 200u was the most effective intervention. BoNT-A 300u was the most effective intervention for reducing incontinence episodes. CONCLUSIONS: BoNT-A may offer the most effective treatment for reducing symptoms of OAB. Accounting for the exchangeability between different modes of administration and treatments within in the same class sufficiently increases the precision in the treatment effect estimates but maintains the interpretability of the individual and diverse range of treatment options.

PUS4 THE BUDGET IMPACT OF TREATMENT PATHWAY REDESIGN IN MEN WITH LOWER URINARY TRACT SYMPTOMS (LUTS) ASSOCIATED WITH BENIGN PROSTATIC HYPERPLASIA (BPH)

Patel S.1, Garnham A.1, Niazii P.1

1Astellas UK, Chertsey, UK, 2Astellas Pharma EMEA, Chertsey, UK

OBJECTIVES: LUTS associated with BPH (LUTS/BPH) in men may present as a combination of voiding, storage and post-micturition symptoms. UK prescribers have proposed two areas of improvement to current care: first, acknowledging that α-blocker monotherapy may not address bothersome storage symptoms; and second, building confidence in primary care to prescribe drug combinations for mixed symptoms. We built a model to evaluate the potential budget savings from implementing these treatment pathway changes. METHODS: A model was built in Microsoft® Excel to depict a simplified LUTS care pathway, aligned with current clinical practice and NICE treatment recommendations in a hypothetical cohort of 10,000 men with LUTS/BPH who have moderate-to-severe storage and voiding symptoms. The budget impact of a proposed pathway redesign was calculated, which could adjust the number of men diagnosed and managed in primary care. Men could receive a range of treatments at varying times in the treatment pathway. We further adjusted for differences in baseline severity of the patient population, as different interventions are used at varying times in the treatment pathway. The primary outcomes of interest were mean change from baseline for voiding, urgency, and incontinence episodes. RESULTS: The model estimated several annual cost savings: £2,964,169 by increasing the proportion of men diagnosed and managed in primary care rather than secondary care; £1,138,040 by increasing the proportion of men receiving initial LUTS/BPH treatment in primary rather than secondary care from 50% to 60%; and £4,114,738 by increasing the proportion of men receiving combination rather than monotherapy from 6% to 20%. A combination of the above interventions resulted in a saving of £8,208,661. Variation in drug choice or cost were shown to have minimal financial impact. CONCLUSIONS: The pathway redesign indicates substantial savings. Specifically, increasing primary care diagnosis and treatment of LUTS/BPH symptoms would avoid referral costs and potentially delay surgery, while increasing general practitioner confidence
