We present here the synthetic routes and the experimental data (NMR and MS spectra) for model reactions for copper-free Huisgen 1,4-cycloaddition, Staudinger ligation and for addition of a dithiol on a dibromomaleimide ring. Starting materials were synthesized from the commercially available 4-chlorophenethylamine, previously described 2-(cyclooct-2-yn-1-yloxy)acetic acid, 1-fluorocyclooct-2-ynecarboxylic acid, commercial 2-(diphenylphosphino)terephthalic acid 1-methyl 4-pentafluorophenyl diester and dibromomaleimide. In all cases, the expected compounds were obtained with good yield (50% to quantitative). A novel synthesis of the lipid anchor DOGP3NH2 is also described. These data were used as basis for the study reported in the article “Smart Tools and Orthogonal Click-like Reactions onto Small Unilamellar Vesicles” in Chemistry and Physics of Lipids [1].

1. Data

All the described $^1$H NMR and $^{13}$C NMR spectra, as well as MS spectra, are available as annexes to this article.

$^1$H NMR spectra at either 300 MHz, 400 MHz or 500 MHz and $^{13}$C NMR spectra at either 75 MHz, 100 MHz or 133 MHz were recorded on Brucker spectrometers either 300, 400 or 500 respectively with residual undeuterated solvent as internal reference. All chemical shift values ($\delta$), coupling constants ($J$) and the multiplicity ($s =$ singlet, $d =$ doublet, $t =$ triplet, $m =$ multiplet, $br =$ broad) are quoted in ppm and in Hz, respectively. High-resolution mass spectra (HRMS) were obtained using an Agilent Q-TOF (time of flight) 6520 and low-resolution mass spectra (LRMS) using an Agilent MSD 1200 SL (ESI/APCI).

2. Experimental design, materials and methods

Reagent grade solvents were used without further purification. Polymer supported triphenylphosphine and anhydrous CH$_2$Cl$_2$ were purchased from Sigma-Aldrich. The PyBOP was purchased from Novabiochem, the DIEA was from Alfa Aesar, and both were used without further purification. Column chromatography was carried out on silica gel 60 (Merck, 70 – 230 mesh). Analytical RP–HPLC–MS was performed using a C18 column (30 mm × 1 mm; 1.9 μm) using the following parameters: (1) the eluent system A (0.05% TFA in H$_2$O) and B (0.05% TFA in acetonitrile); (2) the linear gradient $t = 0$ min with 98% A, $t = 5$ min with 5% A, $t = 6$ min with 5% A, $t = 7$ min with 98% A, and $t = 9$ min with 98% A; (3) flow rate of 0.3 mL min$^{-1}$; (4) column temperature 50 °C; (5) ratio of products determined by integration of spectra.
recorded at 210 or 254 nm; and (6) ionization mode ESI. TLC spots were detected by UV irradiation at 254 nm or with KMnO4 stain.

2.1.1. Preparation of \((2,3\text{-bis((Z)-octadec-9-en-1-yloxy)propoxy)methanetriyl})\text{tribenzene (DIB-1)}\)

A 50% aqueous NaOH (647 mg, 16.6 mmol) solution was added to a mixture of oleyl-OMs (11) (1.15 g, 3.30 mmol), 3-(trityloxy)propane-1,2-diol (S-1) (285 mg, 0.83 mmol) and \((\text{Bu}_4\text{N})\text{HSO}_4\) (28 mg, 0.08 mmol). The solution was stirred at 65 °C for 3 days. CH₂Cl₂ (50 mL) was added and the layers were separated. The aqueous layer was washed with CH₂Cl₂ (2 × 50 mL). The organic layers were combined, dried and concentrated under vacuum. The residue was purified by chromatography on silica gel using cyclohexane/EtOAc (100/0–95/5) as eluent to obtain 600 mg of \((2,3\text{-bis((Z)-octadec-9-en-1-yloxy)propoxy)methanetriyl})\text{tribenzene (DIB-1)}\) as a colorless oil; \(^1\text{H} \text{NMR (400 MHz, CDCl}_3): \delta \text{7.48–7.44 (m, 6H of C}_6\text{H}_3), 7.32–7.24 (m, 12H of C}_6\text{H}_5), 5.41–5.35 (m, 4H), 3.58–3.53 (m, 4H), 3.43–3.39 (m, 3H), 3.19 (m, 1H) 2.02–1.91 (m, 10H), 1.38–1.20 (m, 44H), 0.90 (t, \text{J} = 6.8 \text{ Hz, 2CH}_3); \text{HRMS (ESI)} \text{m/z calcd. for C}_58\text{H}_90\text{O}_3\text{Li}^+, 841.7050; \text{found 841.7096.}
