Social and vocational re-entry of dysexecutive patients

C. Vallat
Antenne UEROS-SAMSAH 92-UGECAMIDF, hôpital Raymond-Poincaré, AP–HP, 104, boulevard Raymond-Poincaré, 92380 Garches, France
E-mail address: claire.vallat@rpc.aphp.fr

Keywords: Executive functions; Vocational rehabilitation
Disorders of executive functions are associated with both social and vocational re-entry difficulties. Following pioneer works in North America showing the effectiveness of the supported employment approach for social reintegration and return to work of brain injured patients [2,3], specialised community-re-entry programmes have been developed in France, such as the UEROS programme or specialised community-based services (SAMSAH) [1]. We present personal data from our community-re-entry programmes and discuss the contribution of the social supports in the rehabilitation of the executive functions.

Forensic assessment of cognitive disorders

P. Azouvi
Service de MPR, hôpital Raymond-Poincaré, université de Versailles-SQ, 104, boulevard Raymond-Poincaré, 92380 Garches, France
E-mail address: Philippe.azouvi@rpc.aphp.fr

Keywords: Executive functions; Forensic assessment
Forensic assessment of dysexecutive disorders is difficult, due to the frequent patient’s lack of awareness, and to the lack of sensitivity of conventional neuropsychological tests. This presentation will emphasize the use of behavioural questionnaires and of ecological assessment.
