Conflict of interests: All of the authors declare that they have no conflicts of interests.

Laurus nobilis is a common plant in the Mediterranean area, and is used in several cosmetic products and remedies due to its claimed analgesic, antioxidant and anti-inflammatory effects (1). Laurel oil contains cineol, pinene, citral, terpineol, and several sesquiterpene lactones (2). Contact allergy to laurel has been mostly

reported in aromatherapists and patients who apply herbal oils for joint pain (3–6).

Case Report

A 62-year-old white woman presented with a 10-day history of itching eczematous lesions around her eyes, cheeks, and neck (Fig. 1), where she had applied a cosmetic oil, Gamila Secret[®], for the previous 3 weeks. This oil contained, according to its label, several plant

extracts: *Vitis vinifera* seed oil, *Prunus amygdalus dulcis* oil, *Simmondsia chinensis* seed oil, *Lavandula angustifolia* oil, *Nigella sativa* seed oil, *Olea europaea* fruit oil, *Persea gratissima* oil, *L. nobilis* leaf oil, *Pistacia vera* seed oil, and *Inula helenium* extract. The patient was treated with an oral antihistamine and hydrocortisone cream, and the lesions subsequently healed.

One month later, patch testing was performed with Finn Chambers[®], according to the ICDRG criteria, with the Portuguese baseline series, cosmetic and excipient series, individual components of fragrance mixes I and II, plant series, linalool and limonene hydroperoxides, the patient's own products, including the Gamila Secret[®] oil 'as is', and laurel leaf oil and lavender essential oil, the only two components available. The patient had positive reactions at day (D) 2 and D4 to Compositae mix II 5% pet. (Chemotechnique[®], Vellinge, Sweden) (+), to sesquiterpene lactone mix 0.1% pet (Chemotechnique[®], Vellinge, Sweden) (++), to the Gamila Secret[®] oil 'as is' (++), and to laurel leaf oil 2% pet. (Bial[®], Coronado, Portugal) (+) (Fig. 2).

Discussion

We report a case of allergic contact dermatitis caused by laurel oil following the application of a cosmetic oil containing *L. nobilis* leaf oil. Contact allergy to laurel oil is rare, and only a few cases have been described from the skin application of laurel oil skin as a massage oil (4–6). However, we cannot exclude the possibility of contact allergy to other allergens contained in the cosmetic oil, as not all of the ingredients were available for patch testing.

Positive reactions to *L. nobilis*, Compositae mix and sesquiterpene lactone mix suggest the diagnosis of sesquiterpene lactone-induced allergic contact dermatitis. The role of sesquiterpene lactones in patients sensitized to laurel oil has been discussed in some studies (7, 8). The sesquiterpene lactones are characterized by the presence of a γ -butyrolactone ring with an exocyclic α -methylene group. Numerous different molecules with this structure are present in plants of the families Compositae (Asteraceae), Magnoliaceae, Winteraceae, Jubulaceae, and Lauraceae (9). Contact allergy is directed primarily against the α -methylene group. Cross-reactions among plants belonging to the Compositae family, plants of the genera *Frullania* (Jubulacea family) and *Laurus* (Lauracea family) and various members of the family Magnoliacea, such as *Michelia lanuginosa*, have been described in the literature (7, 9, 10). Patients allergic to laurel oil should therefore avoid products containing extracts, and contact with plants, known to contain sesquiterpene lactones.

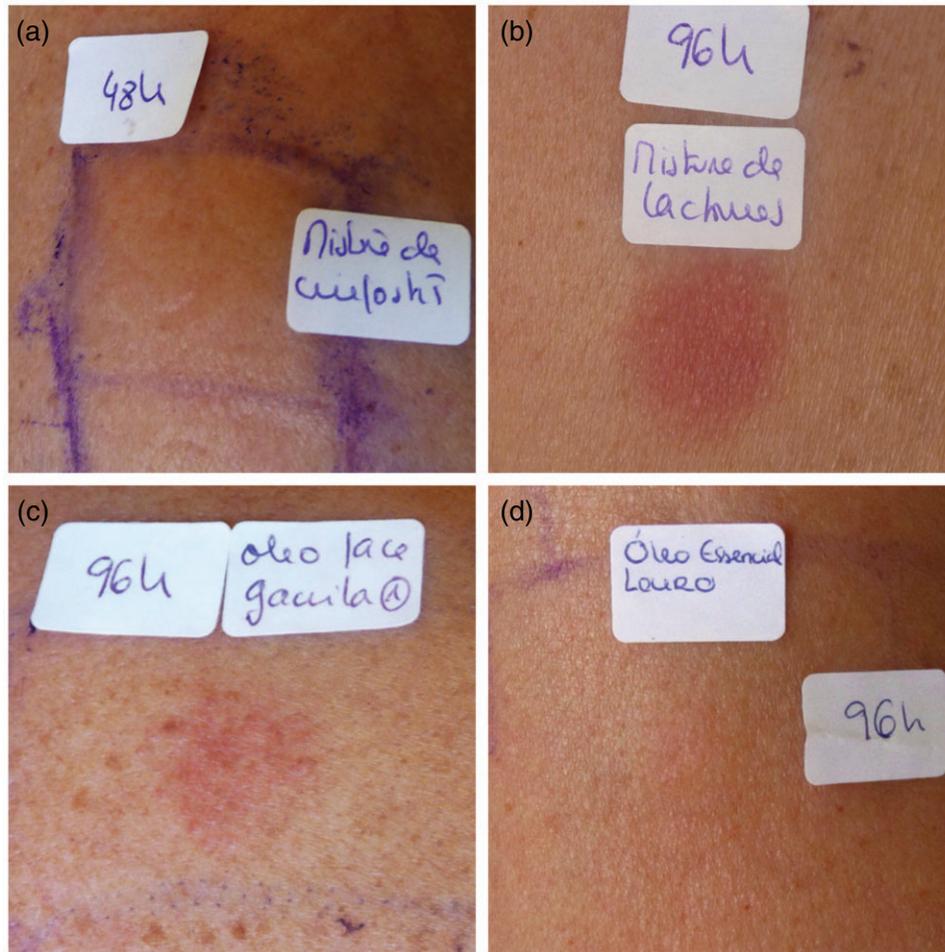

Fig. 2. Positive patch test reactions to Compositae mix II (+) at D2 (a), sesquiterpene lactone mix (++) at D4 (b), Gamila Secret[®] oil 'as is' (++) at D4 (c), and laurel leaf oil (+) at D4 (d).
