## ACKNOWLEDGEMENT

The writers wish to acknowledge the technical guidance provided by Mr. Henry E. Stem, Deputy Manager of the Nuclear and Plasma Physics Division of the Space Sciences Laboratory, George C. Marshall Space Flight Center, the technical monitor of this contract.

The Writers also appreciate the able assistance provided by Mr. John Watts of the Nuclear and Plasma Physics Division of the Space Sciences Laboratory in completing portions of this contract effort.

## FOREWORD

This report is Volume 2 of six volumes of the final report on "Nuclear Rocket Shielding Methods, Modification, Updating, and Input Data Preparation." This work was performed for the George C. Marshall Space Flight Center (MSFC), Huntsville, Alabama, under Contract No. NAS-8-24919, Control No. DCN 1-X-80-00056. The technical monitor of this contract was Mr. Henry E. Stern, Deputy Manager of the Nuclear and Plasma Physics Division of the Space Sciences Laboratory, MSFC. A description of the compilation of neutron and photon, cross section library data is presented in this volume.

In summary, the six volumes of the final report are as follows:

- Volume 1: "Synopsis of Methods and Results of Analyses" - A summary of the work performed under this contract,
- Volume 2: "Compilation of Neutron and Photon Cross Section Data" - A description of the six Master Libraries of neutron and photon, cross section data,
- Volume 3: "Cross Section Generation and Data Processing Techniques" - A description of the GAMLEG-W, APPROPOS, NAGS, and SATURN codes,
- Volume 4: "One-Dimensional, Discrete Ordinates Transport Technique" - A description of the ANISN-W code,
- Volume 5: "Two-Dimensional, Discrete Ordinates Transport Techniques" - A description of DOT-IIW, DOQ, ADOQ, and MAP codes, and
- Volume 6: "Point Kernel Techniques" - A description of the KAP-VI and SCAP codes.

## ABSTRACT

This report is Volume 2 of six volumes of the final report on "Nuclear Rocket Shielding Methods, Modifications, Updating, and Input Data Preparation". This volume describes the compilation of neutron and photon cross section data.

The compilation and preparation of neutron and photon cross section data are subdivided into the following categories:

- 1) Neutron cross sections for the ANISN-W and DOT-IIW discrete ordinates transport codes and their auxiliary codes;
- 2) Photon cross sections for the ANISN-W and DOT-IIW discrete ordinates transport codes, the KAP-VI point kernel code, and the SCAP single- and albedo-scatter code;
- 3) Preparation of multigroup cross section sets (with upscatter removed, if desired), using the WANL modified version of the ANISN code or the APPROPOS cross section preparation code;
- 4) Basic, nuclear data for nuclear and radiation analysis of a nuclear system.

The multigroup cross sections described in this volume are applicable for the analysis of graphite-moderated, nuclear reactor, rocket systems.

## 1.0 INTRODUCTION

This is Volume 2 of six volumes of the final report on "Nuclear Rocket Shielding Methods, Modification, Updating, and Input Data Preparation". This volume describes the compilation of neutron and photon cross section data.

The neutron and photon cross section libraries are an integral part of both the preliminary or parametric and the detailed design radiation analysis methods provided to MSFC under this contract and the previous contractual work (NAS-8-20414). A schematic diagram of each method is shown in Figures 1-1 and 1-2. Both methods are described in Volume 1 of this report.

In the preliminary or parametric design method (Figure 1-1), the APPROPOS code (Volume 3) is used to prepare neutron and photon cross sections and other basic data for use in the transport and data processing codes. The cross sections are input to the ANISN-W code (Volume 4). The ANISN-W code computes one-dimensional neutron and photon fluxes in the reactor geometry. From the neutron fluxes, neutron and photon energy sources and distributions are obtained using the NAGS data processing code (Volume 3). The sources and distributions are used as input to the KAP-VI point kernel code (Volume 6). The KAP-VI code provides gamma ray and fast neutron radiation levels at locations external to the reactor. Radiation sources, heat generation rates, and radiation environment, both internal and external to the reactor as well as shield effectiveness, can be computed using the preliminary or parametric design method.

In the detailed design method (Figure 1-2), the neutron and photon cross sections prepared by the APPROPOS code (Volume 3) are used as input data to the DOT-IIW, two-dimensional, discrete ordinates transport code. The DOT-IIW code (Volume 5) computes the two-dimensional neutron and photon fluxes throughout the reactor geometry. The NAGS data processing code (Volume 3) processes these fluxes and calculates neutron and photon energy deposition and neutron and photon energy sources and distributions within the reactor system. These sources and distributions are used as input to the KAP-VI point kernel code (Volume 6). In addition, the surface leakage fluxes from the DOT-IIW problem geometry

are used as input to the MAP radiation transport code (Volume 5). The MAP code computes the radiation environment at selected surfaces or points external to the DOT-IIW geometry and includes provision for last-flight transport using optional, point kernel techniques. The SCAP single- or albedo-scatter code (Volume 6) is used to compute external radiation environment using, as source input data, the output from either the KAP-VI or the MAP codes. Radiation sources, heat generation rates, and radiation environment, both internal and external to the reactor as well as shield effectiveness can be computed using the detailed design method.

The SATURN (Volume 3), DQQ and ADOQ (Volume 5) codes are additional data preparation and handling codes. These codes are provided as convenient tools for manipulating large quantities of data or for providing selected input data.

Section 2.0 summarizes the neutron and photon cross section data compiled for the Marshall Space Flight Center (MSFC). A brief description of each of the five MSFC Master Library Tapes is included.

Section 3.0 describes the basic neutron, cross section libraries provided under this Contract and the method of computation.

Section 4.0 describes the basic photon cross section libraries provided under this Contract. A brief description of how these data are used in the respective codes is provided.

Section 5.0 describes two techniques for the preparation of few group cross section data using the Master Libraries described in this volume.

Section 6.0 describes the basic, nuclear data provided under this Contract and the method of computation.

A tabulation of pair-production, photo-electric, and Compton absorption as well as Compton scatter and the total gamma ray cross section by element is listed in the APPENDIX. These data are provided from 0.01 to 20.0 MeV.

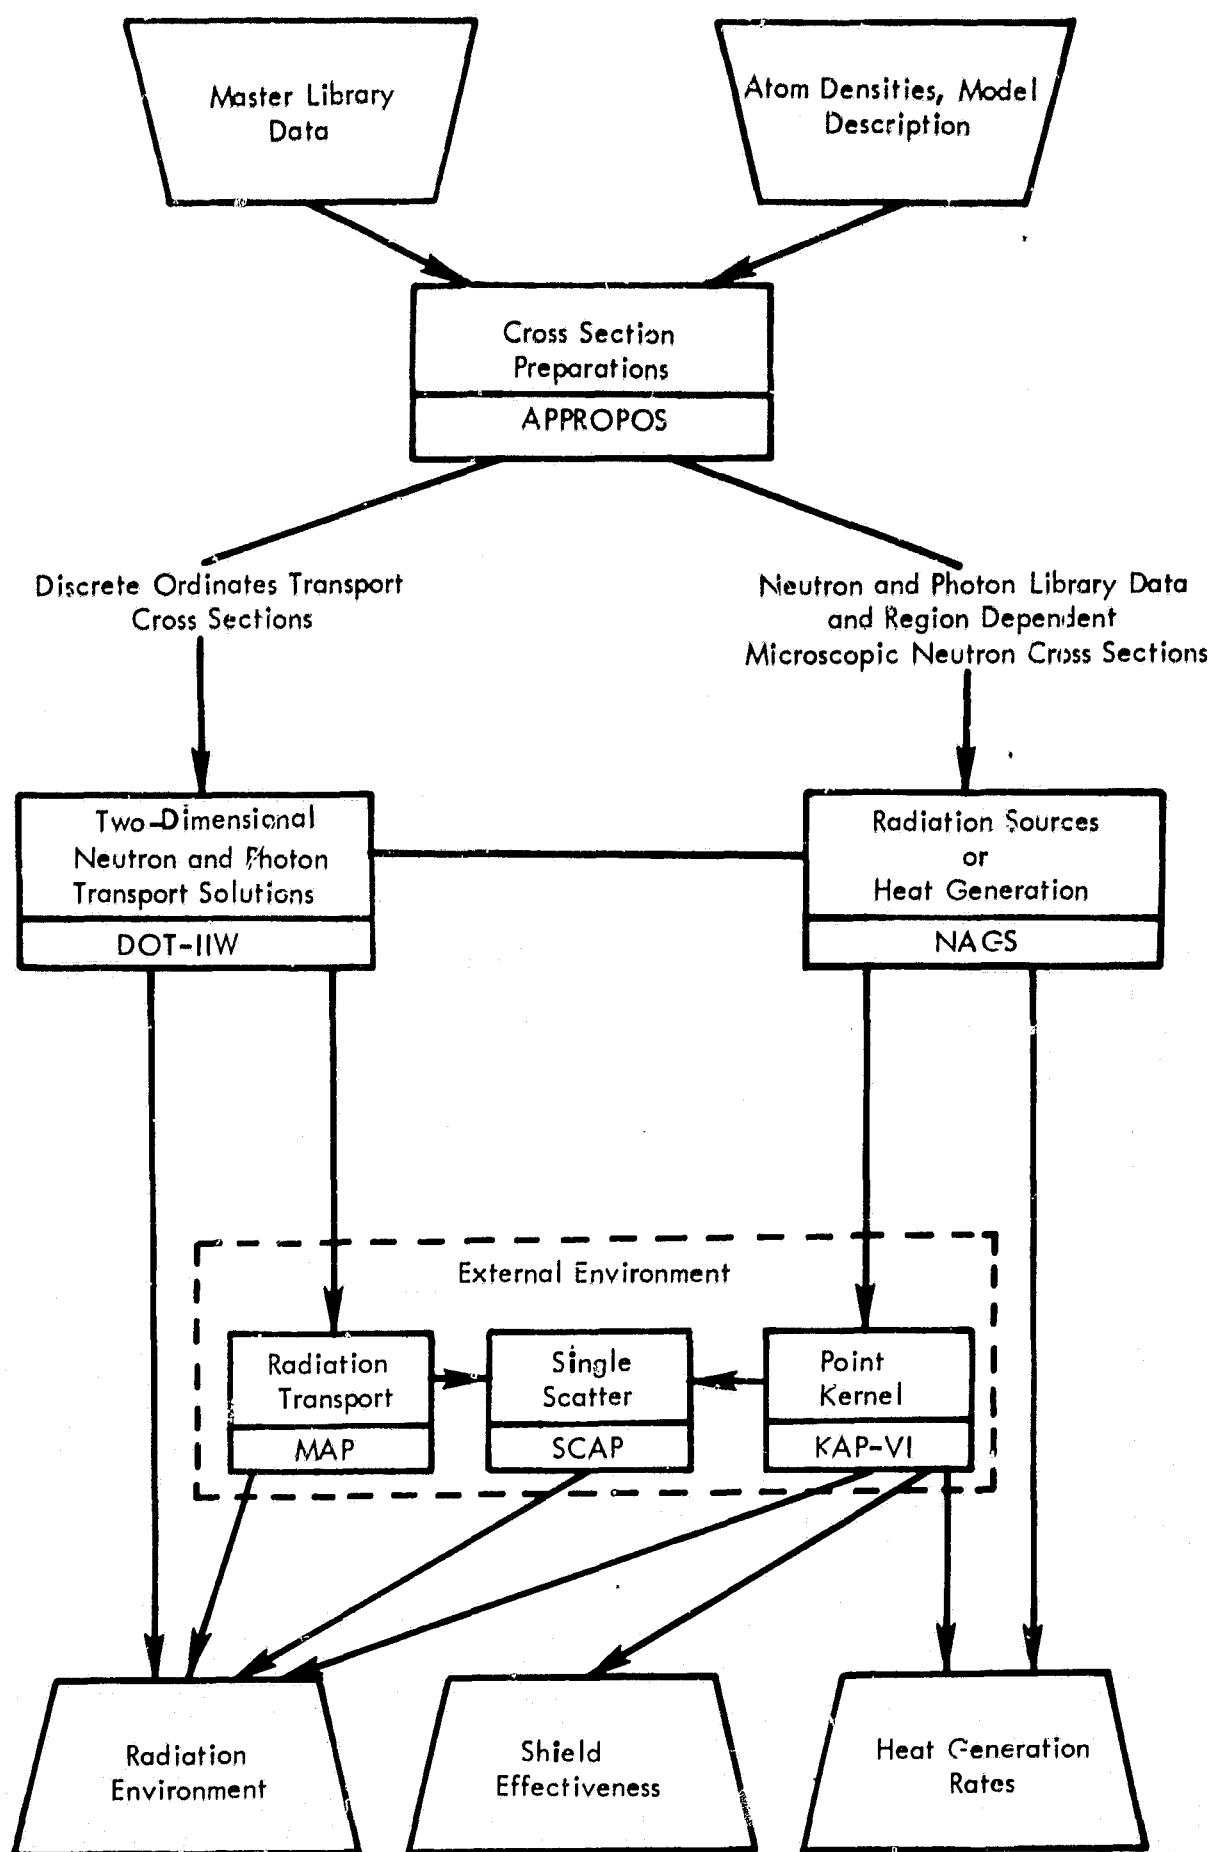

Figure 1-2. Flow Chart for Detailed Radiation Analysis

## 2.0 SUMMARY AND CONCLUSIONS

The compilation of neutron and photon cross section data for MSFC has generated five Master Library Tapes and a deck of basic nuclear data. (See Table 2-1.)

Master Library Tape No. 1 contains 135 microscopic, transport corrected, neutron cross sections sets for 36 elements for use in the ANISN-W, DOT-IIW, and APPROPOS codes. These data are in a 52 energy group structure. Master Library Tape No. 2 contains 413 microscopic,  $P_\ell$  ( $\ell \leq 3$ ) neutron cross section sets for 36 elements for use in the ANISN-W, DOT-IIW, and APPROPOS codes. These data are also in a 52 energy group structure. Master Library Tape No. 3 contains 134 sets of reaction rate cross section data for use in the APPROPOS code. The data on Master Library Tapes No. 1, 2, and 3 are averaged over four representative, spatially dependent, neutron spectra obtained from current R-1 nuclear subsystem design work. These first three tapes are obtained in a manner consistent with each other and with the nuclear and radiation analysis procedures used in the radiation analysis of reactors at the Westinghouse Astronuclear Laboratory (WANL).

Master Library Tape No. 4 contains 510 microscopic,  $P_\ell$ , gamma ray cross section sets for 51 elements for use in the ANISN-W, DOT-IIW, and APPROPOS codes. These data, which are in a 13 energy group structure, are averaged over a source spectrum of prompt gamma ray energy emitted from the fission of  $^{235}\text{U}$ . Master Library Tape No. 5 contains the pair-production and photo-electric gamma ray cross section data used in the KAP-VI, SCAP, MAP, and GAMLEG-W codes. Again, the data on Tapes 4 and 5 are obtained in a manner consistent with each other and with the radiation analysis procedures used in the radiation analysis of reactors at WANL.

Finally, a basic set of nuclear data is generated for use in the complete package of codes.

### 3.0 NEUTRON CROSS SECTIONS

A multigroup, microscopic library of neutron cross sections has been prepared for use in the discrete ordinates transport codes, DOT-IIW and ANISN-W. Table 3-1 lists the 35 elements (or isotopes) for which cross section sets have been supplied. Transport corrected\* and full  $P_1$  scattering-approximation cross sections were generated for the elements (or isotopes) noted in the Table. Each microscopic cross section set was spectrally weighted over four representative flux and current spectra. These spectra, as shown in Table 3-2, are selected from the NERVA project analyses of the current R-1 nuclear subsystem design and represent the spatially dependent neutron spectra in the R-1 reactor system. Full  $P_3$  scattering-approximation cross sections for neutron energies greater than 1.86 eV are supplied for 16 elements, as specified in Table 3-1. These data are weighted over a  $1/E$  spectrum. In addition, a vane prescription cross section set weighted over the R-1 reflector spectrum is included to represent the NERVA reactor peripheral control drums containing  $^{10}\text{Boron}$ . In one-dimensional (ANISN-W) or  $r, z$  two-dimensional (DOT-IIW) calculations, an annular ring containing the vane prescription cross section set is employed to represent the control drums.

All neutron cross sections are obtained in a manner consistent with the nuclear and radiation analysis procedures used in the radiation analysis of reactors at WANL. This cross section library is most applicable for radiation analyses of nuclear rocket reactors; however, the 52 energy group data are considered to be adequate for parametric survey calculations of other nuclear systems, as well.

#### 3.1 BASIC LIBRARY DATA

The multigroup structure of the microscopic neutron library is shown in Table 3-3. These 52 energy groups consist of 32 groups in the fast energy range (from 1.86 eV to

---

\* The transport correction made in neutron cross sections involves the flux weighted  $P_0$  cross sections, and the diagonal transport approximation using the current weighted  $P_1$  cross section,  $\sum_{g=1}^G \sigma_{gg}^{-1}$ , to obtain the correction term,  $1/3 \sum_{g=1}^G \sigma_{gg}^{-1}$ , where  $G$  is the total number of neutron groups. The term is subtracted from the total cross section and the within group scattering cross section  $\sigma_{gg}$ .

$1.0 \times 10^7$  eV) and 20 groups in the thermal energy range (from 0.0 eV to 1.86 eV). The probability of neutron upscatter or downscatter is included in the thermal range data up to the upper limit of 1.86 eV; the probability of downscatter is included in the fast range data from 1.86 eV to 10.0 MeV. The group structure shown in Table 3-3 is chosen for the following reasons:

- 1) Adequate high-energy group structure to provide reaction rates for heating calculations, comparisons with activation measurements, and representation of anisotropic scattering,
- 2) Adequate epithermal energy group structure to define the  $^{235}\text{U}$  cross section in the resonance range (lethargy greater than 12),
- 3) Computer code storage limits,
- 4) Multigroup cross sections collapsible directly to few-group cross sections. This means that every few-group break point must fall at a multigroup break point. The motivation for this criterion is that ANISN-W or APPROPOS can be used to perform the group collapse,
- 5) Sufficient thermal energy range group structure to adequately define the downscatter-upscatter cross sections,
- 6) Adequate thermal energy range group structure to equalize the relative influence of each thermal group in transport calculations, and
- 7) Reasonable computer running time.

Using this 52 energy group structure, 548 neutron cross section sets and 134 reaction rate sets are generated at room temperature (except where noted) for use in the ANISN-W and DOT-IIW discrete ordinates transport codes. Each neutron cross section set consists of 52 groups and 34 cross section types for a total array size of 1768.

Each energy group contains 34 different types of cross sections as follows:

- 1)  $\sigma_g^a$ , in position 1, the total absorption cross section, i.e., radiative capture,  $(n;2n)^*$ , fission,  $(n;p)$   $(n,\gamma)$ , etc. For most elements, this cross section is the radiative capture cross section.
- 2)  $\nu_g \sigma_g^f$ , in position 2, the product of the fission cross section and the average number of neutrons released per fission event.

---

\* The  $(n, 2n)$  reaction is treated as a negative absorption cross section

3)  $\sigma_g^t$ , in position 3, the total collision cross section. When transport corrected cross sections are used, this table position contains the total collision cross section corrected by the diagonal transport approximation term. This correction term for anisotropic scattering has been computed by the diagonal transport approximation using the current weighted total  $P_1$  scatter cross section,  $\sum_{g=1}^G \sigma_{g' \rightarrow g}$ , to obtain the correction term  $1/3 \sum_{g=1}^G \sigma_{g' \rightarrow g}$ . This correction term has been subtracted from the total collision cross section and the within-group scattering cross section,  $\sigma_{gg}$ , for the transport corrected data set.

4 to 13)  $\sigma_{g'g}$  for  $g' > g$ , in positions 4 to 13, inclusive, the upscatter transfer cross section (always considered to be transfer into a group). The 13th position cross section in group 1 would represent transfer from group 2 into group 1, for example. These transfer cross sections are the sum of the elastic, inelastic, and where applicable ( $n;2n$ ) reaction cross sections.

14)  $\sigma_{g'g}$  for  $g' = g$ , or simply,  $\sigma_{gg}$ , in position 14, the within-group transfer cross section defined as:

$$\sigma_{gg} = \sigma_g^t - \sigma_g^a - \sum_{g=1}^G \sigma_{g'g} \text{ for } g' \neq g$$

15 to 34)  $\sigma_{g'g}$  for  $g' < g$ , in positions 15 to 34, inclusive, the downscatter transfer cross section (always considered to be transfer into a group). For example, the 15th position in group 2 would represent transfer from group 1 into group 2. These transfer cross sections are the sum of the elastic, inelastic, and where applicable, ( $n;2n$ ) reaction cross sections.

Impossible transfer elements, such as upscatter into group 52, are entered as a zero. The vane prescription data set and each neutron cross section set are given a unique four-digit identification number. The first two digits of the identification number denote the particular element or isotope of the cross section library, the third digit denotes the spectrum over which the cross section data is averaged, and the fourth digit denotes the cross section type ( $P_1$ ,  $P_2$ ,  $P_3$ , etc.). Table 3-4 specifies the element or isotope identification number, Table 3-2 specifies the spectrum, and Table 3-5 specifies the cross section type.

The neutron cross section sets are contained on two library tapes; the first tape contains only transport corrected cross-section data; the second tape contains the  $P_\ell$  cross section data. Table 3-6 lists the cross section sets on the transport corrected data tape. This table lists the element or isotope and its identification number, the spectrum over which it is averaged, and the sequence with which it is placed on tape. Table 3-7 lists the cross section sets on the  $P_\ell$  data tape. This table lists the element or isotope and its identification number, the spectrum over which it is averaged, the  $P_\ell$  order, and the sequence with which it is placed on tape. The  $P_2$  and  $P_3$  cross section sets for hydrogen are assumed independent of temperature or the type of hydrogen so that all the  $P_2$  data for hydrogen are identical to one another as are the  $P_3$  data. The same assumption is used for the  $P_2$  or  $P_3$  data for any given element that appears more than once. By repeating the element in the proper sequence, continuity of tape ID numbers and user convenience are achieved.

The 52 group, ring vane prescription is contained on both library tapes. The microscopic cross section data on these two magnetic tapes are in a format consistent with the input requirements of the ANISN-W and DOT-IIW discrete ordinates transport codes and of the APPROPOS cross section preparation code.

Fifty-two neutron energy group, microscopic, reaction rate cross section data are also generated for 35 elements or isotopes, averaged over the same four representative R-1 spectra. These microscopic reaction rate cross sections contained on Master Library Tape No. 3 are:

- 1)  $\sigma_g^c$ , the capture cross section which includes  
 $\sigma(n,\gamma)$ ,  $\sigma(n;p,\gamma)$ , and  $\sigma(n;\alpha,\gamma)$  reactions,
- 2)  $\sigma_g^f$ , the fission cross section for fissionable isotopes; non-fissionable elements or isotopes contain zeros for this cross section,
- 3)  $\sigma_g^{el,eff}$  the "effective" energy deposition cross section which was computed by

$$\sigma_g^{el,eff} = \frac{\Delta E_g}{\Delta U_g} \times \frac{2A}{(A+1)^2} \times (1 - \mu_g^{cm}) \times \sigma_g^{el}$$

where:

$\frac{\Delta E_g}{\Delta U_g}$  is the average energy of group g,

$\frac{2A}{(A+1)^2}$  is the average energy loss per collision,

$(1 - \mu_g^{cm})$  is the correction term for anisotropic scattering,

$\Delta E_g$  is the energy width of group g,

$\Delta U_g$  is the lethargy width of group g,

A is the atomic mass of the scattering nucleus,

$\mu_g^{cm}$  is the average cosine of the scattering angle in the center-of-mass coordinate system for group g, and

$\sigma_g^{el}$  is the total microscopic elastic scattering cross section for group g,

4)  $\sigma_g^{n,n'}$ , the total inelastic scattering cross section for group g.

The use of an effective energy deposition cross section facilitates rapid computations of the direct neutron kinetic energy deposition due to neutron elastic scattering. The effective energy deposition cross section is calculated in a consistent manner with the data on Master Library Tapes No. 1 and 2.

The capture cross section is used in the calculation of the secondary gamma ray source due to  $(n, \gamma)$ ,  $(n;p, \gamma)$ , and  $(n;\alpha, \gamma)$  reactions. The fission cross section is used in the calculation of prompt and delayed gamma ray source due to the  $(n, f)$  reaction. The effective energy deposition cross section is used in the calculation of neutron kinetic energy deposition due to neutron elastic scattering. The inelastic scattering cross section is used in the calculation of the secondary gamma ray source due to the  $(n; n', \gamma)$  reaction.

Table 3-8 lists the reaction rate microscopic cross sections contained on Master Library Tape No. 3, the identification number, the spectrum over which the data are averaged, and the order in which they are placed on tape. These data are used primarily by the APPROPOS code.

### 3.2 METHOD OF COMPUTATION

A consistent, microscopic neutron transport library of cross sections in 52 energy groups is generated for the Marshall Space Flight Center. These cross sections are obtained in a manner consistent with the nuclear and radiation analysis procedures used in the radiation analysis of reactors at WANL.

The GAMBIT<sup>(3.1 - 3.4)</sup> code is used to generate the larger portion of the library. This code provides group averaged, flux and current weighted, neutron cross sections based on a thermal cross section Master Library consisting of 99 fine groups (0 - 2.38 eV), a fast neutron cross section Master Library consisting of 68 fine groups (0.414 eV - 10 MeV, 1/4 lethargy intervals), and a detailed set of element resonance parameters for the 68 fine groups.

The generation of basic neutron cross section data for the Master Libraries has been carried out in recent years by the Reactor Physics and Mathematics Department of WANL. Considerable effort is expended in preparing and evaluating basic neutron cross section data (i.e., smooth cross sections, resonance parameters, scattering kernels, inelastic matrices, etc.) for use in the GAMBIT code. The Master Libraries for GAMBIT are based on the GAM-I and TNS libraries<sup>(3.5)</sup> and recent evaluations of neutron cross section data.<sup>(3.6 - 3.13)</sup> The references for the changes and additions to these libraries, based on new measurements, analytical models, and evaluations, is shown in Table 3-9 for the elements in the MSFC library. These references detail the method of cross section evaluation and the basic data source.

$P_2$  and  $P_3$  multigroup scattering matrices for 16 elements were generated using the TRANSFER<sup>(3.14)</sup> code. These cross sections are weighted over a 1/E spectrum and are generated only for the 32 fast groups ( $E > 1.86$  eV) as anisotropic scattering effects are most significant for high neutron energies. Input to the TRANSFER code consists of the pointwise total scattering cross section and the coefficients,  $f_\ell(E)$ , in the Legendre expansion of the differential elastic scattering cross section  $\sigma_{n,n}(E, \theta)$ :

$$\sigma_{n,n}(E, \theta) = \frac{\sigma_{n,n}(E)}{4\pi} \sum_{\ell=0}^{\infty} (2\ell + 1) f_\ell(E) P_\ell(\cos \theta)$$

where  $f_0(E) = 1$

The required input data are obtained from References 3.15 to 3.24. The punched output from the TRANSFER code is input to an auxiliary code to (1) repunch the cards in a format acceptable to the ANISN-W, DOT-IIW, and APPROPOS codes, and (2) perform specific error checks. These checks<sup>(3.25)</sup> tested for the integral conditions that the  $P_0$ ,  $P_1$ ,  $P_2$ , and  $P_3$  transfer matrices must satisfy. These conditions are:

1) The sum  $\sum_g \sigma_{g'g}^{P_0}$ , for  $g \leq g'$  should equal the average (1/E weighting) of the elastic scattering cross section over group g,

2) The ratio  $\sum_g \sigma_{g'g}^{P_1} / \sum_g \sigma_{g'g}^{P_0} = 2/A$ , for  $g \leq g'$ ,

3) The ratio  $\sum_g \sigma_{g'g}^{P_2} / \sum_g \sigma_{g'g}^{P_0} = 1.25$  for  $A = 1$ , or

$$= 1/A^2 \left[ 1 + \sum_{n=1}^{\infty} \left( \frac{1}{(2n-1) \cdot 7A^{2n}} \right) \right] \text{ for } A > 1$$

4) The sum  $\sum_g \sigma_{g'g}^{P_3} = 0$

where A is the mass number of the scattering nucleus.

The above conditions are based on the assumption that:

- 1) The elastic scattering is isotropic in the center-of-mass coordinate system, and
- 2) The elastic scattering cross sections are averaged over a 1/E spectrum.

The cross sections were then placed on Library Tape No. 2 for use in the ANISN-W, DOT-IIW, and APPROPOS codes.

## 4.0 PHOTON CROSS SECTIONS

The point kernel and discrete ordinates transport codes of the MSFC code package use the same basic, photon, cross section library data and techniques. A basic library of energy dependent, photo-electric and pair-production data is used in the KAP-VI point kernel code, the SCAP single- or albedo-scatter, point kernel code, the MAP radiation transport code, and the GAMLEG-W multigroup, cross section preparation code. These codes calculate Compton scattering cross sections from the Klein-Nishina equation<sup>(4.1)</sup> and absorption cross sections from the basic library data to provide total cross section data. The numerical techniques used in the KAP-VI, SCAP, MAP, and GAMLEG-W codes are completely consistent; the final form of the data, however, is dependent on the code's individual requirements. A discussion of the basic library data is presented in Section 4.1; the generation of photon cross sections in each type of code is described in Sections 4.2 and 4.3.

### 4.1 BASIC LIBRARY DATA

The KAP-VI, SCAP, MAP, and GAMLEG-W codes in the MSFC code package accept the same basic pair-production and photo-electric cross section data. These data are punched on data cards for input to the GAMLEG-W<sup>(4.2)</sup> code. The GAMLEG-W code generated Master Library Tape No. 5. This tape contains the cross sections to be used as input to each of the codes (including subsequent use in GAMLEG-W).

The basic, pair-production and photo-electric data are obtained from Reference 4.3. These data are compiled in tabular form for the 51 elements shown in Table 4-1. Pointwise data are provided at energy points in the range of 0.01 MeV to 20.0 MeV. The number of energy points for each element data is dependent on the number of points required to accurately describe the variations of the data with energy. For photo-electric absorption, the presence of a double valued function at the K, L, and M electron shell absorption edges is represented in the library by the use of continuous data, i.e., values of the cross section at two energy points,  $E_K + \delta$  and  $E_K - \delta$ , as shown in Figure 4-1 (where  $\delta$  was on the order of 0.001 MeV).

A description of the format of the pair-production and photo-electric cross section library tape is shown in Table 4-2. As indicated, each element requires that the data be in order of increasing photon energy. Five binary records describe each element on the magnetic tape. This magnetic tape contains a title record as the first record on tape. The specific energy points and cross section values are listed in Appendix A.

#### 4.2 CROSS SECTIONS FOR USE IN POINT KERNEL CODES

The MSFC codes, which apply the point kernel technique, obtain photon cross sections in a consistent fashion. These codes are:

- 1) KAP-VI - a revised version of the KAP-V point kernel code,
- 2) SCAP - a single- or albedo-scatter, point kernel code of similar geometry capability to KAP-VI, and
- 3) MAP - a radiation transport code which includes point kernel techniques. The MAP code uses the surface angular fluxes from the DOT-IIW code as angular dependent source data.

Each of the above codes use the magnetic tape library data as input to a separate subroutine in each code. This subroutine calculates the absorption cross section,  $\sigma_a(E_i)$ , as the sum of the photo-electric absorption cross section,  $\sigma_{pe}(E_i)$ , and pair production absorption cross section,  $\sigma_{pp}(E_i)$ . The absorption cross section is then interpolated at specified energy point values,  $E_K$ . The interpolation technique employs a linear variation of the logarithm of the cross section values with the logarithm of the energy for the two energy points bounding the input specified energy value,  $E_K$ . Two special conditions of interpolation are included:

- 1) If either cross section value bounding the energy point is 0.0, then a linear variation of cross section value with energy is assumed, and
- 2) If the energy value is outside the energy range of the pointwise library data, then the value is set to the end point value and no extrapolation is performed.

Total cross section data are obtained using different techniques in the KAP-VI, MAP and SCAP codes. Each technique is described in the following paragraphs.

#### 4.2.1 KAP-VI and MAP Total Photon Cross Sections

The calculation of the total cross section is identical in the KAP-VI and MAP codes. The two codes require total cross section data at input specified energy points only. The interpolated absorption data,  $\sigma_a(E_K)$ , described earlier are combined with the Compton scatter cross section,  $\sigma_c(E_K)$ , to provide the total cross section  $\sigma_t(E_K)$ . The Compton cross section in units of barns/electron is calculated from the Klein-Nishina equation for the inelastic scattering of a photon of energy,  $E_K$ , with a free electron as follows:

$$\sigma_c(E_K) = \left(\frac{3}{8}\right)(0.665) \frac{\ln(1+2E_K)}{E_K^2} \left[ E_K - 2 - \frac{2}{E_K} \right] + 4 + \frac{2E_K^2(1+E_K)}{(1+2E_K)^2}, \quad E_K \text{ is in units of electron rest masses.}$$

The total cross section,  $\sigma_t(E_K)$ , in barns, is then defined as,

$$\sigma_t(E_K) = \sigma_a(E_K) + Z_i \cdot \sigma_c(E_K)$$

where  $Z_i$  is the atomic number (electrons/atom) of the element. These data are converted into mass absorption data ( $\text{cm}^2/\text{gm}$ ) for each element for use in the KAP-VI and MAP calculations. A description of each code's use of these data is presented in Volumes 3 and 4.

#### 4.2.2 SCAP Total Cross Section Data

In the single- or albedo-scatter code, SCAP, the numerical techniques used to obtain the total cross section differ because cross section data for primary radiation of input specified energy,  $E'_{K'}$ , and the single scattered energy,  $E''_{K''}$  are required. For this reason, the SCAP code computes the absorption cross sections at input specified energy values,  $E_K$ , as described earlier. These data are then interpolated during a SCAP calculation to the required energy values,  $E'_{K'}$  and  $E''_{K''}$ . Interpolated values are combined with calculated values of the Compton cross section,  $\sigma_c(E'_{K'})$  and  $\sigma_c(E''_{K''})$  to provide total cross sections for the primary leg and single scattered leg attenuation calculations. The detailed use of cross section data in the SCAP code is described in Volume 4.

#### 4.3 DISCRETE ORDINATES TRANSPORT CROSS SECTIONS

The same pair-production and photo-electric cross section tape that is used in the KAP-VI, SCAP, and MAP codes is also used in the GAMLEG-W multigroup, cross section preparation code. The GAMLEG-W code combines these data with the Compton absorption cross section to obtain the total absorption cross section. The Klein-Nishina equation is solved for the inelastic scattering of a photon with a free electron. The doubly differential scattering cross section is then approximated with a truncated Legendre polynominal expansion of the form:

$$\sigma_s(E' \rightarrow E, \vec{\Omega}' \cdot \vec{\Omega}) = \frac{1}{4\pi} \sum_{\ell=0}^{\infty} (2\ell + 1) P_{\ell}(\mu_0) \sigma_{s\ell}(E' \rightarrow E)$$

where  $\mu_0 = \vec{\Omega}' \cdot \vec{\Omega}$

and  $P_{\ell}$  is a Legendre polynomial.

A generalized Legendre polynomial expansion is included in the GAMLEG-W code so that any  $P_{\ell}$  order may be generated.

A microscopic, multigroup, gamma ray transport cross section tape is generated in 13 energy groups using the GAMLEG-W code for the 51 elements shown in Table 4-1 using a  $P_9$  Legendre polynomial expansion of the scattering cross section. These data are contained on Master Library Tape No. 4. The multigroup structure of this library tape is shown in Table 4-3. This tape format is compatible with the ANISN-W, DOT-IIW, and APPROPOS codes. The tape contains a lead title record of two words, followed by the  $P_0$  data for each element, the  $P_1$  data, etc. A 105 energy point,  $^{235}\text{Uranium}$ , prompt fission photon source spectrum is used for averaging these cross sections. This source spectrum is adequate for photon transport analyses of graphite-moderated, nuclear rocket reactors. When used in the DOT-IIW and ANISN-W discrete ordinates transport codes, these cross sections permit the calculation of energy fluxes in units of  $(\text{MeV}/\text{cm}^2\text{-sec})^2$  as opposed to particle fluxes in units of  $(\text{photons}/\text{cm}^2\text{-sec})^2$ . Energy deposition calculations are more conveniently calculated using energy flux data.

Each gamma ray cross section set consists of 13 groups and 16 cross section types for a total array size of 208 pieces.

Each energy group contains 16 different types of cross sections as follows:

1)  $\sigma_g^a$ , in position 1, the total photon absorption cross section (the sum of the pair-production, photo-electric, and Compton-absorption cross sections).

2)  $\nu_g \sigma_{g,g}^f$ , in position 2, zero for all groups.

3)  $\sigma_g^t$ , in position 3, the total collision cross section, which is the sum of  $\sigma_g^a$  plus the total  $P_0$  component of the Compton scatter cross section  $\sigma_{g,g}^{P_0}$ , calculated from

$$\sigma_{g,g}^{P_0} = \sum_G \sigma_{g,g}^{P_0} \text{ for } g' \leq g$$

4)  $\sigma_{g,g'}^a$ , for  $g' = g$ , or simply  $\sigma_{gg}^a$ , in position 4, the within group scattering cross section defined as:

$$\sigma_{gg}^a = \sigma_g^t - \sigma_g^a - \sum_G \sigma_{g,g}^{P_0} \text{ for } g' \neq g$$

5 to 16)  $\sigma_{g,g'}$ , for  $g' < g$ , in positions 5 to 16, inclusive, the downscatter cross section (always considered to be transfer into a group). For example, the fifth position in group two would represent transfer from group one into group two. These transfer cross sections represent the inelastic scattering of a photon with a free electron as computed by the Klein-Nishina equation.

For the  $P_\ell$  data ( $\ell > 0$ ), table positions 1, 2, and 3 are zero. Impossible transfer elements, such as downscatter into group 1, are entered as zero.

## 5.0 PREPARATION OF MULTIGROUP CROSS SECTION DATA

A 52 energy group, microscopic library of neutron cross sections is prepared for use in the discrete ordinates transport codes DOT-IIW and ANISN-W. Frequently, however, the use does not require this much detail or does not have enough computer core storage available to use these data. For these reasons, the need to reduce the 52 energy group data into "few group" data is evident. In this section, two techniques for generating "few group" data with the MSFC code package and libraries are presented.

### 5.1 USE OF THE ANISN CODE TO PROVIDE GROUP-COLLAPSED DATA

The ANISN-W code (Volume 4) can be used to provide few group data by use of the cross section weighting option to average the 52 group cross section data over the appropriate energy group limits. The averaging is done by using the average, region-flux spectrum as the weighting function. The flux spectrum can be calculated using discrete ordinates or diffusion theory by choosing the appropriate value of IDAT2 in the input data. The user also has the option of using the flux spectrum in an infinite homogeneous medium containing a spatially uniform source of arbitrary spectrum as the weighting function. Because this calculation is spatially independent, requiring only one mesh interval and one inner iteration per group, very little computing time is required.

The technique of group collapsing has two requirements as follows:

- 1) The actual pointwise spectrum in the region must not differ appreciably from the average region spectrum. If the spectrum varies rapidly with spatial position, multiple zones should be used to describe the material.
- 2) The energy bounds of the few group data must correspond to the energy bounds of the 52 energy group data.

When microscopic weighted cross sections are requested, a set of cross sections is produced for each component of each material in each zone. Since the mixing table is used to determine the components of a material, MS in the input data must be greater than zero when microscopic weighting is specified. When macroscopic cross sections are requested, a set of cross sections is produced for each material in each zone.

If the cross section structure for the weighted cross sections will not accommodate the complete multigroup scattering matrix, the "extra" transfer coefficients are placed such that they transfer as far down (or up) as possible.

Upscatter removal is accomplished by zone by subtracting the reaction rate due to  $\sigma_{j \rightarrow i}$  from the reaction rate due to  $\sigma_{i \rightarrow j}$ , where  $j > i$ . Thus, the net transfer rate between groups  $j$  and  $i$  is preserved.

The few group cross sections obtained from ANISN-W can be used for subsequent calculations in the ANISN-W and DOT-IIW codes. The few group energy bounds should coincide with the 16 energy group structure given in Table 5-1 if the data are to be used with the gamma ray energy production data library prepared for the APPROPOS code.

## 5.2 USE OF THE APPROPOS CODE TO PROVIDE GROUP-COLLAPSED DATA

The APPROPOS code can also be used to provide few group data from the 52 group cross section data. The use of the APPROPOS code instead of the ANISN-W code has the following advantages:

- 1) The APPROPOS code does not have the severe core data storage limitations that the ANISN-W code has because the APPROPOS code processes the fine group microscopic data one set at a time instead of all at once.
- 2) The APPROPOS code has the capability of generating coupled, neutron-photon, cross section sets.
- 3) With a set of region dependent spectra as input data or an ANISN-W flux output tape, as many sets of cross sections may be generated, as desired. Any fine group cross section set can be weighted over any input spectra.
- 4) Reciprocal weighting of transport corrected cross sections may be computed, if desired.

In addition, the APPROPOS code has the following features in common with the ANISN-W code:

- 1) The flux weighting algorithm is identical,
- 2) Upscatter removal is identical, and
- 3) The group collapse algorithm is identical.

The APPROPOS code is limited in that only the region dependent flux spectra from an ANISN-W calculation is calculated as a weighting function. However, the use of the weighting function in the APPROPOS code is such that, if provided on cards or tape, the flux and its higher moments can be used as weighting functions.

In general, the APPROPOS code will provide group-collapsed, upscatter-removed, cross section data more conveniently and economically than the ANISN-W code.

TABLE 5-1  
"FEW GROUP" NEUTRON ENERGY GROUP STRUCTURE

<u>"Few Group" Number</u>	<u>Energy Bounds (eV)</u>	<u>Lethargy Bounds</u>
1	$2.87 \times 10^6$ to $1.0 \times 10^7$	0 to 1.25

16	0.0 to $2.0 \times 10^{-2}$	20.03 to $\infty$

## 6.0 NUCLEAR AND RADIATION ANALYSIS BASIC DATA

In the nuclear and radiation analysis of a nuclear system, certain basic, nuclear data are necessary. In this section, the following basic data are described:

- 1) Spectrum of prompt gamma ray energy from the fission of  $^{235}\text{Uranium}$ ,
- 2) Spectrum of decay gamma ray energy from the fission of  $^{235}\text{Uranium}$  as a function of reactor run time,
- 3) Neutron and gamma ray dose conversion factors,
- 4) Spectrum of gamma ray energy due to  $(n, \gamma)$ ,  $(n;p, \gamma)$  and  $(n;\alpha, \gamma)$  reactions, and
- 5) Spectrum of gamma ray energy due to  $(n;n', \gamma)$  reactions.

The above information is included in the basic data library of the APPROPOS cross section preparation code.

### 6.1 PROMPT GAMMA RAY ENERGY SPECTRUM

Table 6-1 shows the spectrum of prompt gamma ray energy emitted from the fission of  $^{235}\text{Uranium}$ .<sup>(6.1)</sup> These data include the isomeric transition gamma rays emitted between 0 and  $10^{-3}$  seconds after fission.<sup>(6.2)</sup> A total of 8.178 MeV/Sec-Fission is released. These data are used in the calculation of the prompt gamma ray distributed source due to  $(n,f)$  reactions.

### 6.2 DECAY GAMMA RAY ENERGY SPECTRUM

Table 6-2 shows the spectrum of decay gamma ray energy as a function of reactor run time from the fission of  $^{235}\text{Uranium}$ . Reactor run times from  $10^1$  to  $10^8$  seconds are included. These data were obtained from the S-4 code.<sup>(6.3)</sup> The spectral dependence was obtained from the 408 code.<sup>(6.4)</sup> These data are used in the calculation of the decay gamma ray distributed source.

### 6.3 NEUTRON AND GAMMA RAY DOSE CONVERSION FACTORS

Conversion factors for obtaining neutron kinetic energy dose rate from neutron fluxes are shown in Table 6-3. Conversion factors for obtaining gamma ray dose rate from photon energy fluxes are shown in Table 6-4. The neutron dose conversion factors are

shown in Table 6-4. The neutron dose conversion factors are obtained from Reference 6.5. The gamma ray dose conversion factors are obtained by hand calculations using the GAMLEG-W energy absorption data.

#### 6.4 CAPTURE GAMMA RAY ENERGY SPECTRUM

The spectrum of gamma ray energy due to the  $(n, \gamma)$  reaction as a function of element (or isotope) is given in Table 6-5. For certain elements, as noted in the table, the spectrum of gamma ray energy is due to  $(n;p, \gamma)$ ,  $(n;\alpha, \gamma)$  or  $(n;t, \gamma)$  reactions. The basic data source for each element or isotope is given in Table 6-6. Comparisons of the literature data are given in Reference 6.6. These data are used in the calculation of the secondary gamma ray distributed source due to  $(n, \gamma)$ ,  $(n;p, \gamma)$ , and  $(n;\alpha, \gamma)$  reactions.

#### 6.5 INELASTIC GAMMA RAY ENERGY SPECTRUM

The spectrum of gamma ray energy due to  $(n;n', \gamma)$  reactions as a function of element (or isotope) is calculated for use in the APPROPOS code and is shown in Table 6-7. The basic data source for each element or isotope is given in Table 6-8. These data contain both continuum and discrete level data, where applicable. The yield data are given as a function of two variables, the excitation neutron energy group,  $E_n$ , and the gamma ray energy group,  $E_\gamma$ .

The POPOP4 code<sup>(6.7)</sup> is used to generate these data. The POPOP4 code is modified to multiply the yield data by the average gamma ray energy of the respective gamma ray group or by the discrete gamma ray energy. This modification is necessary to obtain the gamma ray production data in the proper units. These data are used in the calculation of the secondary gamma ray distributed source due to  $(n;n', \gamma)$  reactions.

## APPENDIX

### PAIR-PRODUCTION AND PHOTO-ELECTRIC DATA

This Appendix presents a tabulation of pair-production, photo-electric, and Compton absorption as well as Compton scatter and the total gamma ray cross section for 51 elements in units of barns/atom ( $\text{cm}^2 \times 10^{24}/\text{atom}$ ). These pointwise data are provided from 0.01 to 20.0 MeV. The pair-production and photo-electric data are obtained from Reference 4.3 and constitute the data on Master Library Tape No. 5. The Compton absorption and scatter are analytically computed from the Klein-Nishina equations given in Reference 4.1.
